PART 1: GENERAL INFORMATION

GENERAL INFORMATION

LIDMASTER PRO and PRO+ LID APPLICATOR MACHINE user manuals include the parts at below.

Manual Type	Operating Worker	Teslim Şekli
User Manual	Machine Operator	With Machine
Installatıion Manual	Service Personnel	With Machine
Spare Part List		With Machine

This user manual belongs to **LIDMASTER PRO& PRO+ LID APPLICATOR MACHINE**. Please read this user manual before operating on machine. Please read completely the operating and maintenance instructions on this user manual. Besides, with the product, it should be considered as a complementary element of product.

This user manual is written to provide adjusting machine healthy and effective, productive and safe usage of it.

Please directly contact with us if any technical problem is not clear in this user manual.

PART 2: MACHINE INFORMATIONS

CE CERTIFICATE

Date:22.08.2017
Place: Gostyn, PL

EC DECLARATION OF CONFORMITY

Declaration Number: DEC170822-2

We, as KANSAN MAKINA KAGIT SAN. VE TIC. AŞ., are a manufacturer settled at the address Capak Mah. 2594 Sok. No:6 Torbali – Izmir 35860 Turkey. We hereby declare that machine, whose name, serial number and model are indicated below, are in accordance with below mentioned standards.

PRODUCT DETAILS
Plastic Lid Applicator Machine – Lidmaster PRO+ Serial Nr: 110, Model Year:2017

CONCERNED STANDARTS
Machine is in conformity with the following standards and normative documents.

EC-Machinery Directive 2006/42/EC
EC-Low Voltage Directive 2014/35/UE
EC-Directive 2014/30/UE EMC

Applied harmonized norms:
EN ISO 12100: safety of machinery, basic concept, general principle for design, Basic terminology and methodology.
PN-EN ISO 13850: Machine Safety E-Stop Rules of Protecting
PN-EN ISO 13857: Mahine Safety Safe Distances for Reach Zones

EN 60204-1: Safety of machinery, electrical equipment of machines, general requirements.

KANSAN MAKINA KAGIT SAN. VE TIC. AŞ.,
Capak Mah. 2594 Sok. No:6 35860 Torbali, Izmir, Turkey

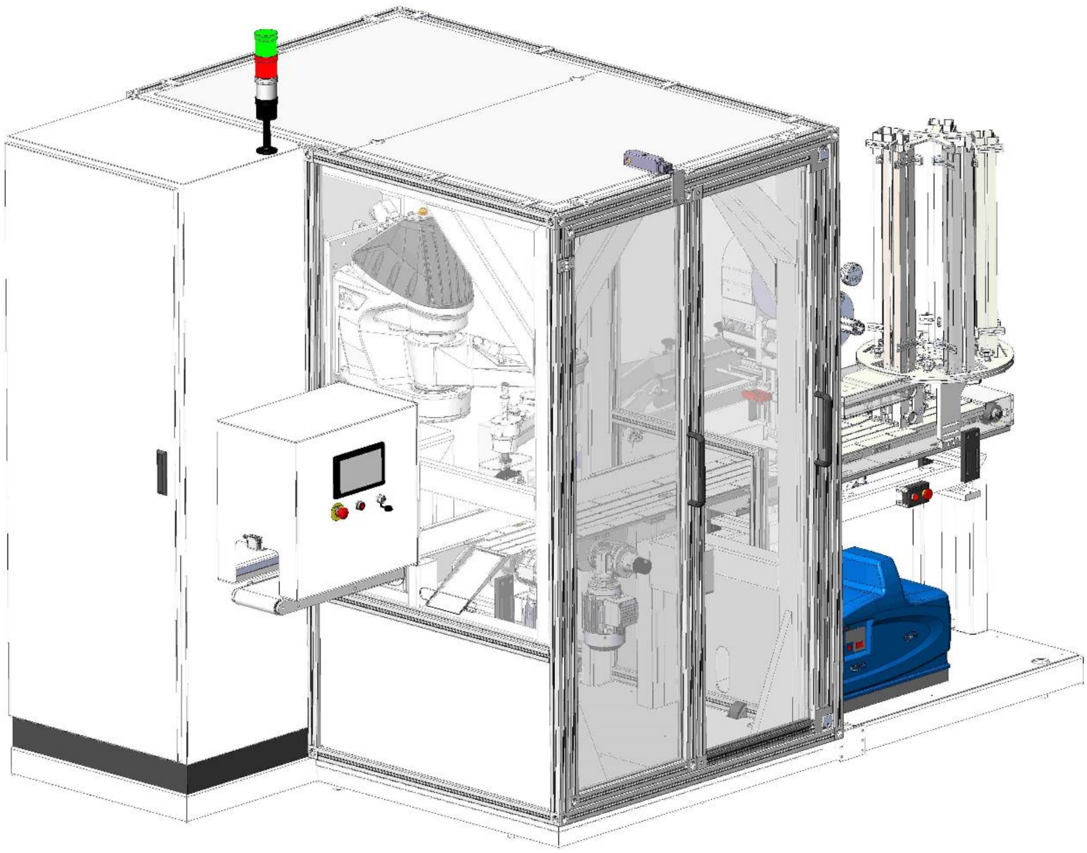
MACHINE GENERAL INSTRUCTION



Get to know Plastic Lid Applicator Machine.

- Plastic Lid Applicator Machine attaches lids to all wet wipe packages.
- Machine only operates with hotmelt.
- Machine operates with appropriate lids which were determined by producer company.
- Lids are stuck on package and must not be removed to prevent tearing.

Machine does not generate higher than 80 dB when operating in normal conditions.

LIDMASTER PRO& LIDMASTER PRO+ is an independent high platform unit which can be placed at the end of flow packing process to apply plastic lids on the top of flow packed packages such as wet wipes.

It functions online or offline with a flow wrapper machine. The unit is equipped with a camera system to visually check the position of label on the packages.

Even if there are incorrect alignments or off-center inflow of product, the advanced robotic system is able to place the lid on the pack in perfect position thanks to 4-axis movement ability.

It is designed and built according to Hygiene, Efficiency, Applicability on Different Formats, User Friendliness criteria.

General Features:

Fully servo driven 4-axis scara type robot arm

Hotmelt application system

Servo controlled lid drive conveyor

Labelling unit

5-magazine rotating lid cartridge system

Antibacterial conveyor belts

Interlock switches on doors

CE compliant

Visual & audible warning systems

Warning alarm for operational errors

Lights in operational sections

Separate pneumatic and electric box

Stations:

a. Input/Output Conveyor

Wet wipe packages are automatically fed into machine on this conveyor. If the incoming packages are sealed on top, another conveyor system will present at the entrance of lid applicator to turn the packages topside down so that the labeled side of the packs shall face up.

b. Camera Station

The camera inside the covered box over the input/output conveyor visually checks the position of the labels on the packages so that the PLC of the machine can make correct calculation for the robot unit to place the lids on correct place and correct alignment.

c. Lid Magazine

Lids are placed in the magazines by operator in proper orientation. The lid drive conveyor automatically takes the lids from the cartridge. Once the lids finished in one magazine the machine automatically rotates the lid magazine to start dispense lids from the second magazine. Machine comes with 5 magazines and automatic rotation system.

d. **Servo controlled lid drive conveyor**

From the lid cartridge, lids are automatically taken and driven on this conveyor to hot melt nozzle

e. **Labeling Unit:**

An Avery Dennison unit is used here to place labels on the incoming plastic lids on lid drive conveyor.

f. **Scara Robot (4-Axis)**

This state-of-art unit takes two lids at a time from lid conveyor and drives them on the hot melt nozzles and finally places them on the packages in correct alignment based on the calculation made by the machine's PLC.

Technical Features

Electronic Equipment:

The entire servo motors on the machine are controlled by motion and PLC.

Control panel:

Touch screen

Past performance checking

Labeling Unit:

AVERY DENNISON ALS 204 model

Dispensing speed: up to 40m/min

Label load speed: max. 300mm

Dispenser (outer) Ø: max. 200mm

Labels: 1.5” / 3” / 4”

Material width (Including backing paper): 10-110 mm

Length of label: 5-500 mm

Label dispensing accuracy: +/-0.5mm

Processor 16 Bit DSP, RAM 4 kByte, ROM 64 kByte

Double line graphic screen, 5 button control panel

RS232 and RS422 connection for remote control

Label sensor for transmission: Wenglor OPT242-P800(NPN)

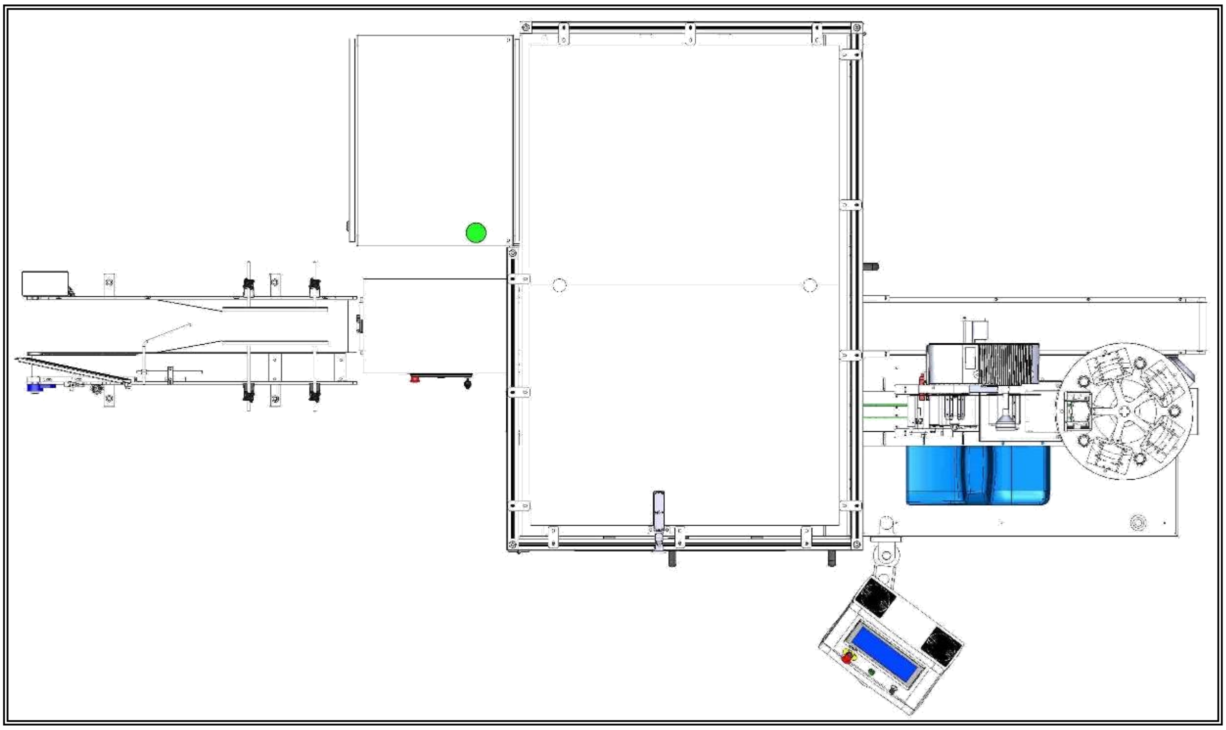
Hot melt Application Unit:

Valco Melton

Nordson (Optional)

Machine Dimension & Layout

Width	: 4447 mm
Length	: 3305 mm
Height	: 2790 mm
Weight	: 1720 Kg



Dimensions of Label Roll

Max. Roll Width	: 100mm
Min Roll Width	: 10mm
Max. Roll Dia.	: 300mm

Lid Dimensions

Length : 70 mm (min.) – 120 mm (max.)

Width : 60 mm (min.) – 90 mm (max.)

Height : 3 mm (min) – 8 mm (max.)

***** A rotating magazine for one type of lid will be provided free of charge. If for more than one type of lid is wanted, additional rotating lid magazines will be at extra cost.***

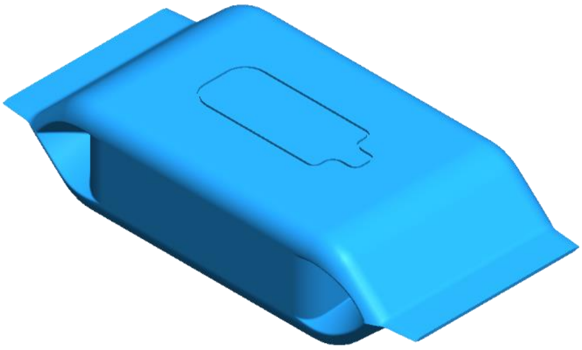
***** Either rectangle or square shape. For oval or any other shapes please consult.***

Product (Package) Dimensions

Width : 55mm- 150mm

Length : 70 mm- 360 mm

Height : 10 mm- 120mm



Capacity

90-110 lids/min*

* may change according to shape and size of lids.

* accuracy: ± 1,5 mm

Air pressure

6-8 bar

Power Supply

400 VAC+N+PE / Network Type: TN-S / 50 Hz –13 kW

Options:

a. Etipack Energy 100 Labelling Unit
b. Herma R400 labeling unit
c. Nordson Problue 4 hotmelt unit
d. AC unit for electrical cabin
e. Quality control camera and rejection system for the packs with missing lids, missing on-lid labels and/or incorrectly lid placed packs.

Components:

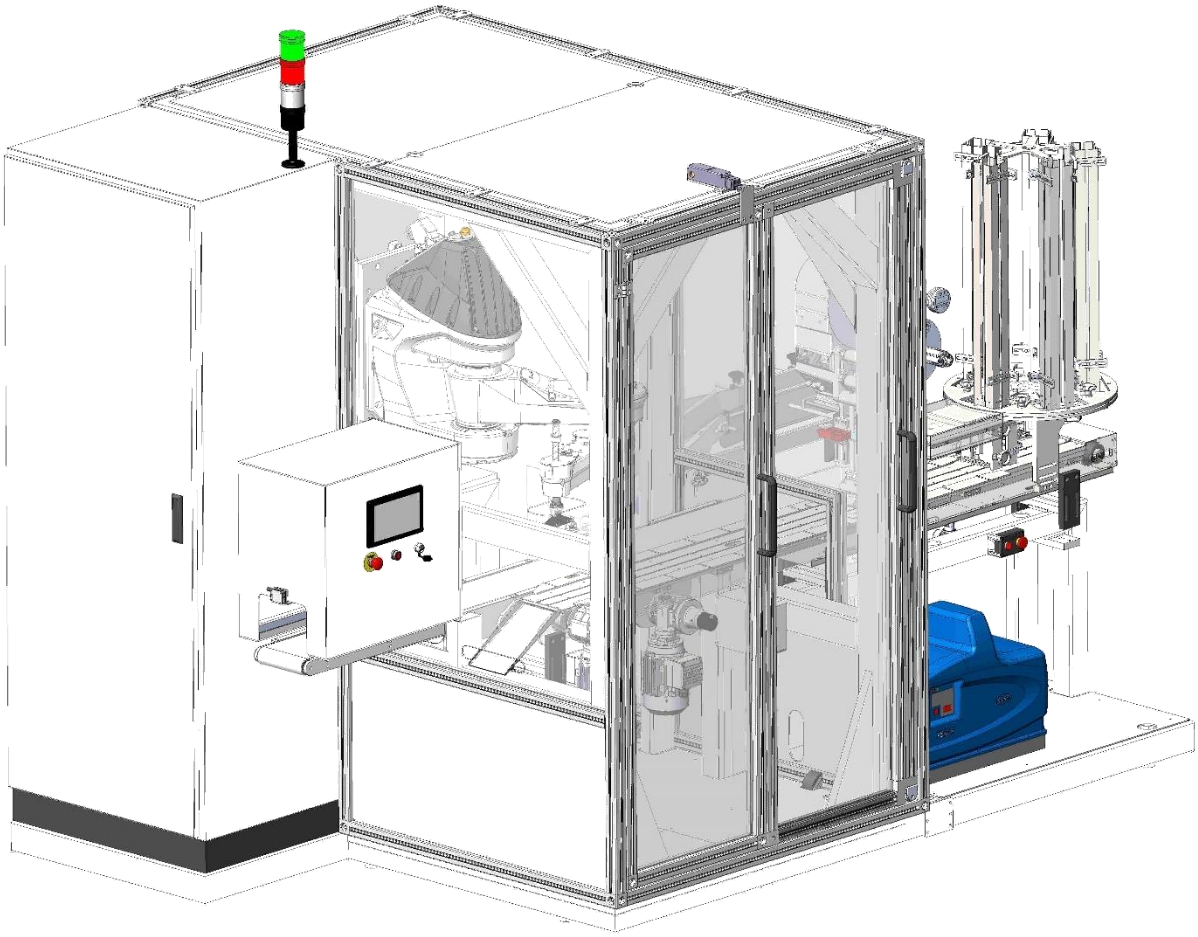
One of our core values is to deliver the promised at highest possible quality level. There are numerous in-house control measures, standards and strict procedures to ensure top quality. Once the excellent craftsmanship is combined with the best components from the leading suppliers of Europe and USA, Dynamic Quality comes into existence.

You may find a short list of the components that we use in our machines. We choose our suppliers very carefully to offer the best available quality to our valued customer.

List of Main Components

Electronic & PLC	: Staubli
Electric Parts	: Schneider, Telemecanique, Phoenix, Contact
Labeling Unit	: Avery Dennison, Herma, Etipack
Gear Box	: Bonfiglioli, Apex, Tramec, Varvel, Wittenstein
Belts	: Optibelt, Megadyne, Isoflex
Pneumatic Parts	: Festo, SMC, Mindman, Pneumax
Sensors	: Sick, Turck, Omron
Bearings	: SKF, Asahi, Nanchi, SNR, Beco, ORD
Linear Bearings	: INA, Hiwin, CPC
Coupling	: KTR, SIT, R+W, Tollflex

MACHINE AIR AND ELECTRIC INFORMATIONS

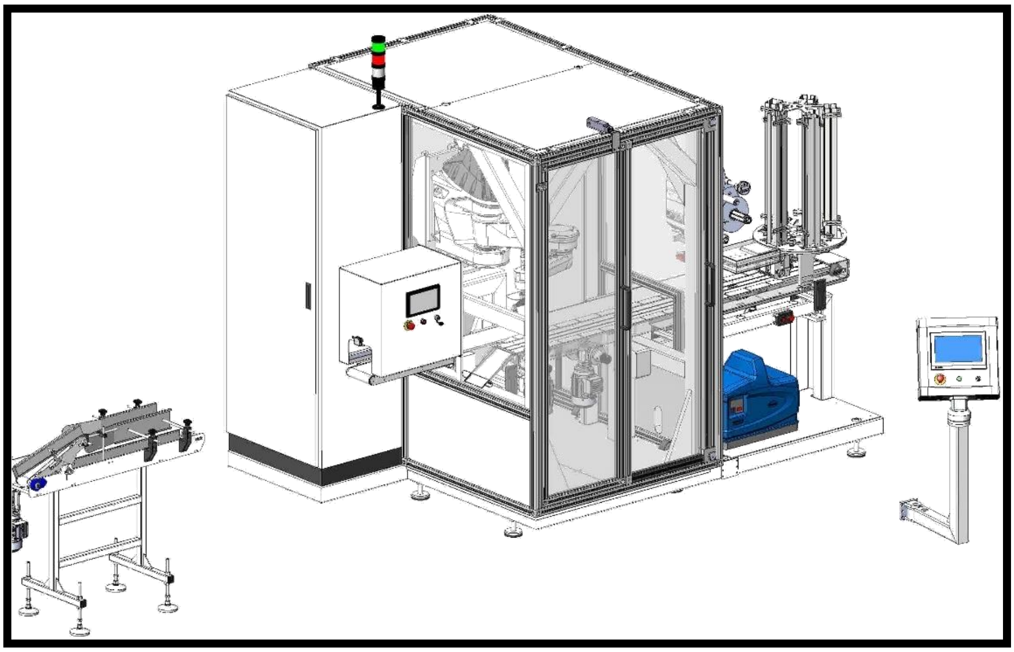


Total Needed Electric Power: *400 VAC+N+PE / Network Type: TN-S / 50 Hz –13 kW*

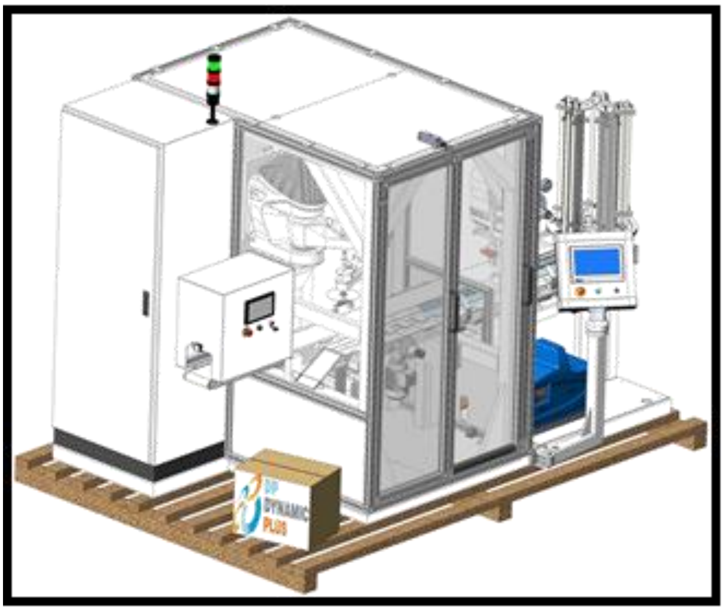
Total Needed Air Pressure Power: *400 Lt/min. – 6-8 Bar*

MACHINE TRANSPORTATION AND INSTALLATION INSTRUCTIONS

The workers who will carry the mahine during transportation and installation must use equipments such as protective googles, gloves and helmet.



- Rotation conveyor must be separated.



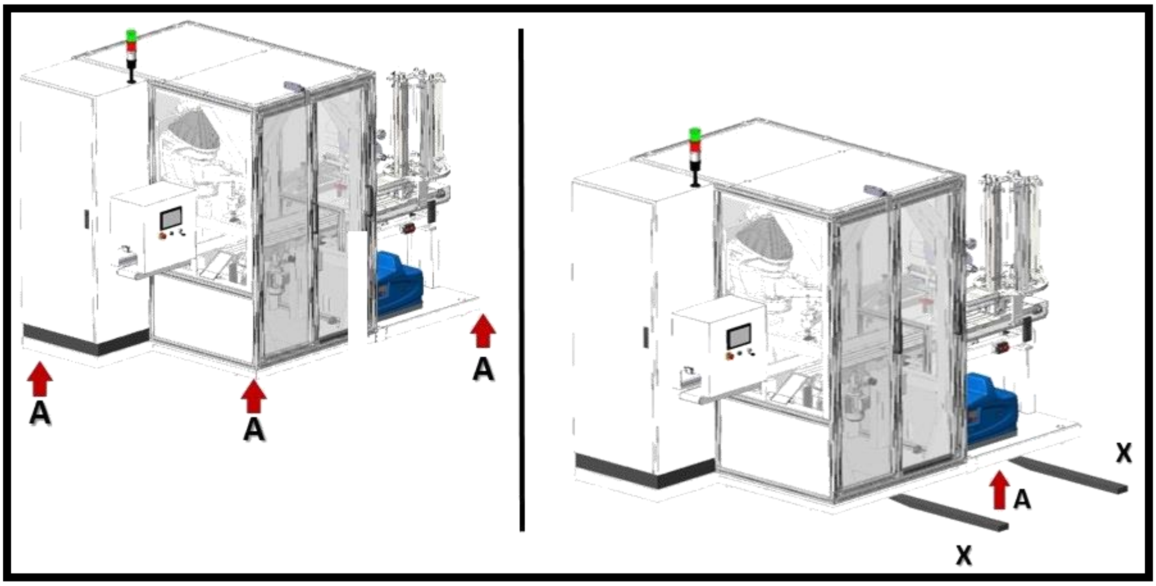
- <u>On Pallet</u>

Cabin Group

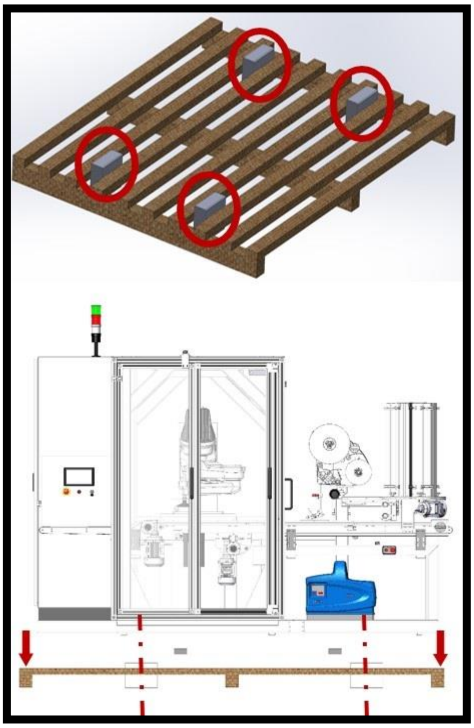
Rotation Conveyor

Spare Part Case

- After machine is packed, it must be carried to transit in appropriate positions.
- Machines, for loading, must be transported in accordance with the specified locations and instructions.
- The installation instructions are used to land again and install.



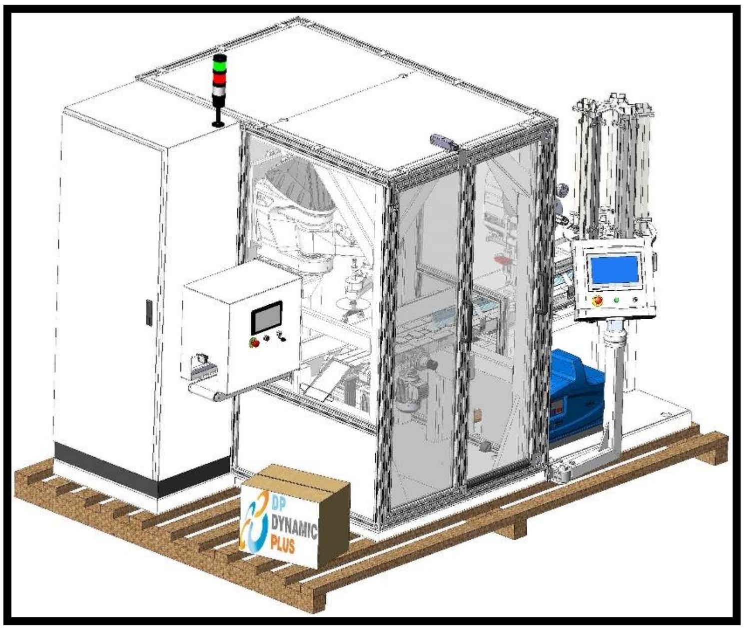
- The machine should be raised from its A point with the help of a jack.
- Raise the machine by placing the forklift blades underneath the machine in the X position.



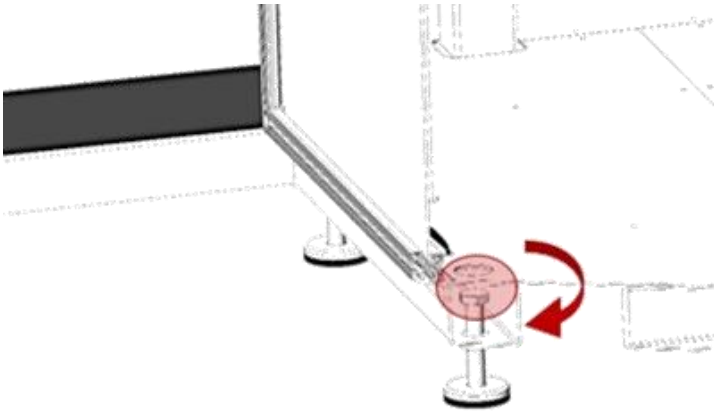
- The pallet spaces prepared for the machine should have more than 4 chocks as shown.

- Leave the machine on the pallet by adjusting the chocks as shown in the picture.

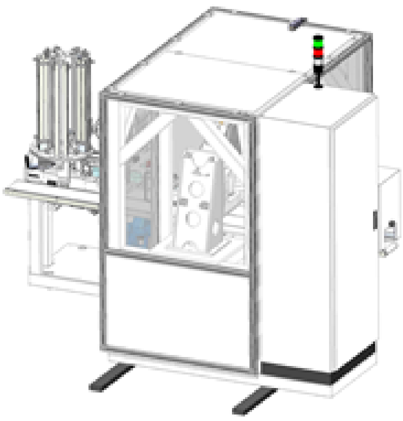
- Remove the forklift blades.

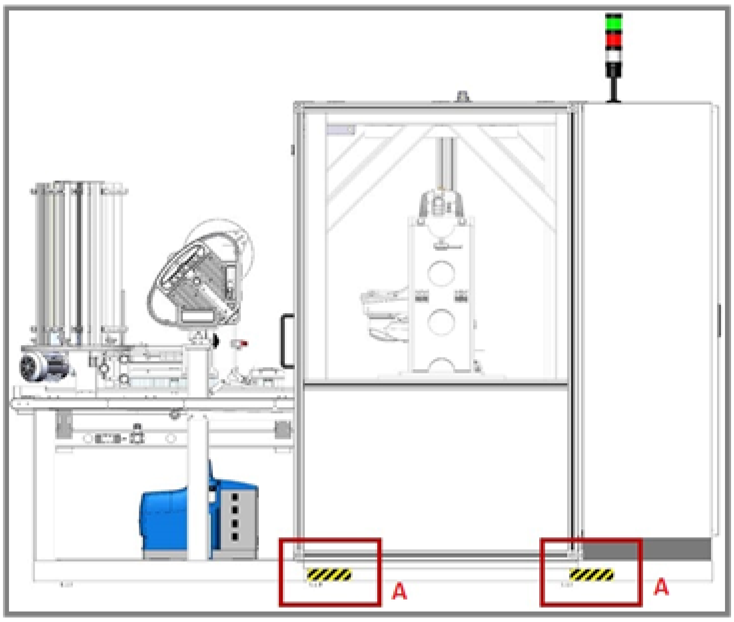


- Forklift blades are lifted from under the pallets and released from the chocks.
- The machine is secured to pallets by scare bolts.
- Landing of machine should also be done with these instructions.



- When the machine is replaced, raise the machine evenly as shown in Picture-B.
- Remove the machine from the indicated A-A zones and carry it with the forklift.
- There is space between the electric cabinet and the machine platform.
- The external components are chosen so that the operating sounds generated inside can be minimized at outside.





MACHINE SCALE AND ELECTRIC PNEUMATOC CONNECTIONS

The machine sachets are assembled according to the relevant layout plan.

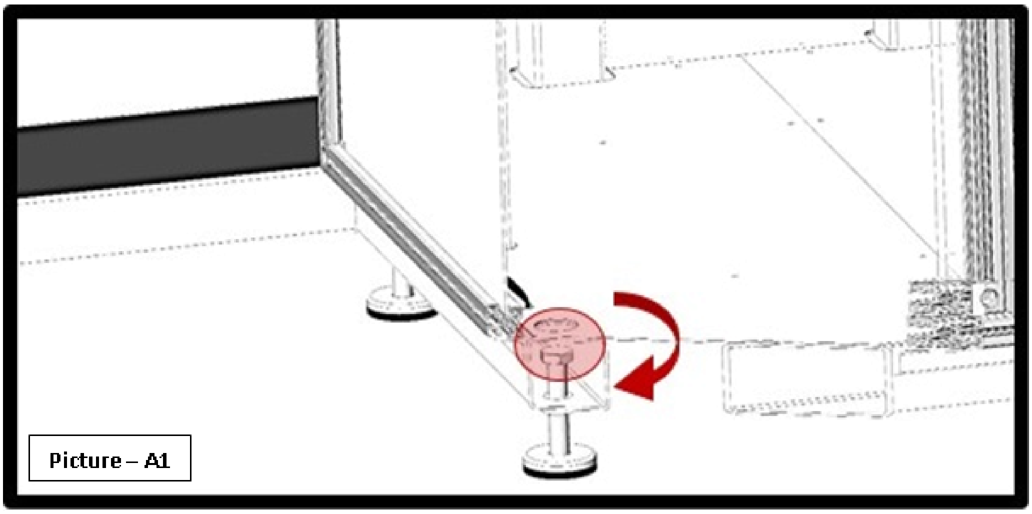
On this operation process, forklift support is needed. To check the modules of machines which are placed are in axis, it is necessary to use the measuremental coordinates or the laser pointer.

After placement, the scales feet **(Picture – A1)** and the parison of the machine floor to machine sachet should be adjusted with the help of a water scale. At the end of this adjustment, the height of the machine should be 30 ~ 60mm above the floor.

These controls should be in appropriate strain setting which is 1 kg pressure and 1 cm stretch.

After the balancing process has been carried out, no factor such as adjustmental failure or service doesn't have to change the balance rate.

The rubber soles shown with "**X**" reduce the vibration that can occur in the machine by 40%. At the end of the installation, you definitely wear these rubber soles.

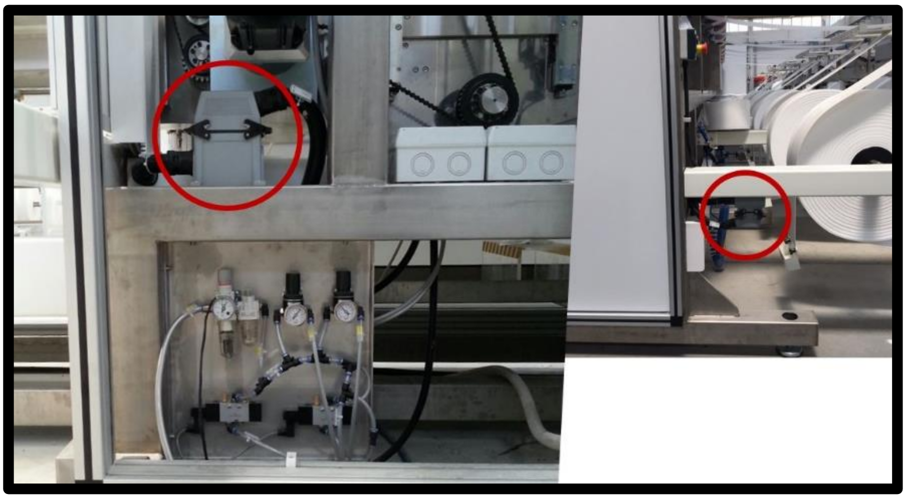


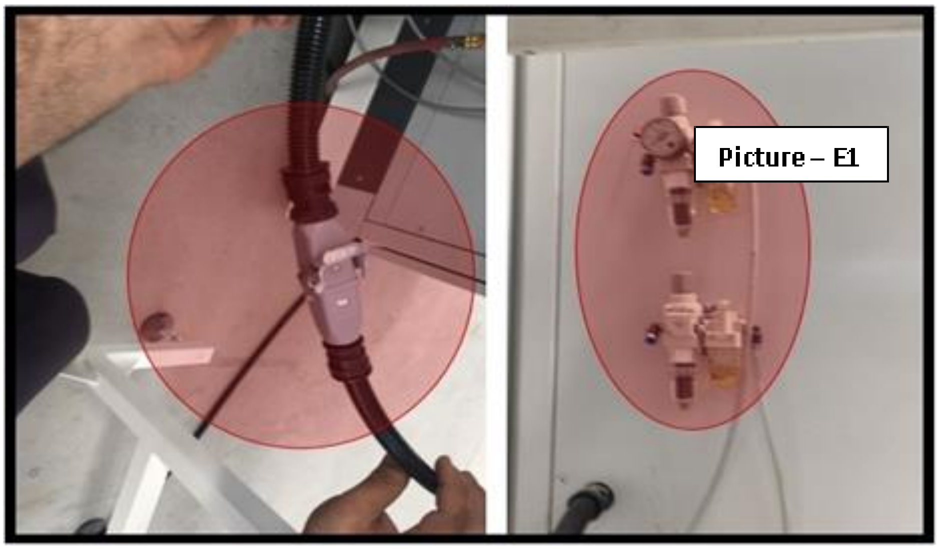
Picture – A1

The first thing to do in electrical and pneumatic connections is to ensure that the main switch and the pneumatic valve are closed. Electric (multiple plug etc.) and pneumatic connections must be made in accordance with their codes. (Picture - E1)

The electrical connection should be tested such that the PHASE-NOTR to 220V, PHASE to PHASE-to-PHASE-380V, SOIL to NOTR will be 0V, such as 3 PHASE - 1 NOTR - 1 SOIL.

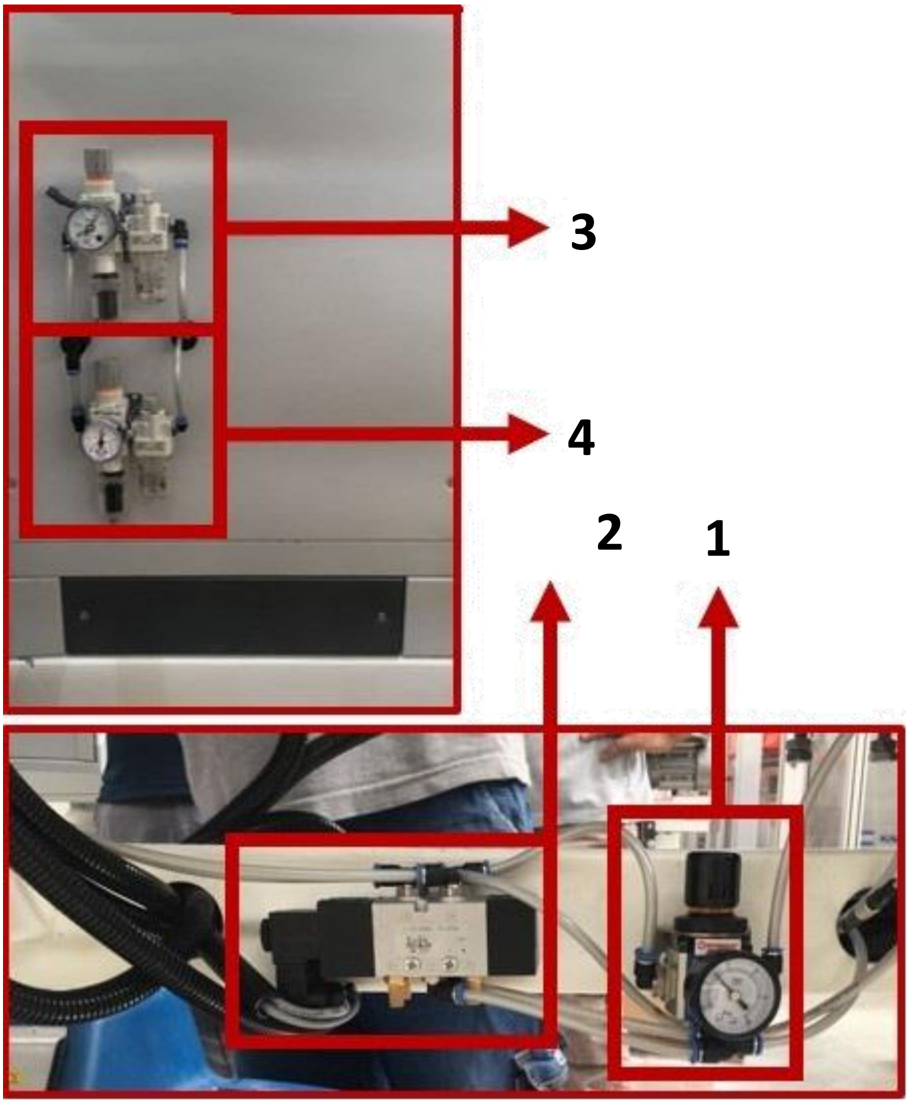
The pneumatic main pressure source should be 7-8 bar. The pneumatic working pressure of our machine is 6 bar.





ELECTRIC PANEL DETAILS

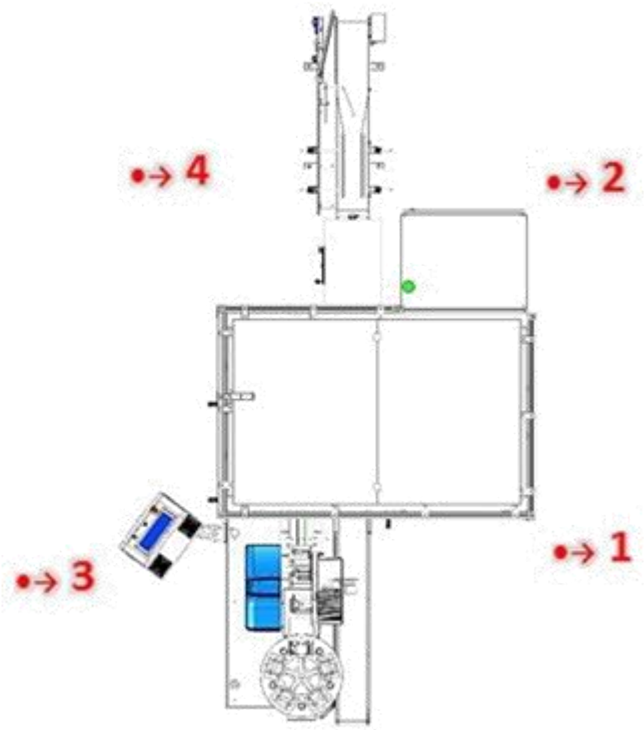
PNEUMATIC DETAILS



1- Regulator
2- 5/2 – 1/8 Pneumatic Valve
3- Main Air Inlet
4- Hotmelt Air Inlet

PART 3: MACHINE GENERAL SECURITY WARNING

EMR VALUES



MEAUSRED VALUES			
MEASURED PLACE	MAGNETIC FIELD nT	ELECTRIC FIELD V/m	HIGH FREQUENCY ELECTROMAGNETIC FIELD (mW/m^2)
1.Point	25	5	0,04
2.Point	25	13	0,03
3.Point	15	14	0,04
4.Point	15	7	0,03

The values of Electric, Magnetic and Electromagnetic Fields in regions where values are indicated in the measured plans(drawings) are lower than the levels to be ionized. Considering exposure over 4-8 hours, all permanant areas are being harmlessly qualified.

Although it is rarely seen high values in front of panel , the area is called “safe” because it has been found that there is no exposure over 4 hours. No shielding or protection work is required.

WARNING LABELS EXPLANATIONS

WARNING SYMBOL	EXPLANATION
	It is not appropriate to open the Staionary Panel without electrical technician or authorized person! Before intervening to Electricity Panel, please look at the relevant document.
	Please contact with our company for problems in the servo driver.Do not intervene without reading the relevant documents.
	High voltage warning. In the case of static reaction, human health and electronic cards are damaged.
	Mains & High-voltage line warning.It is a warning that the jump, boat or plugs are active.
	It is a warning that indicates there are trigger belt systems. If machine operates with, absolutely do not intervene!Make sure the machine is switched off or is not operating during the belt change!

	Ensure that the protective sheet metal is installed in the areas protected by the protective sheet metal.
	It is a warning that tells "do not intervene" except the operator.Intervention by untrained people leads to work accidents!
	It is a band that shows the areas which the carrying will be done.
	It is a warning that indicates the moving rolling cylinder system.
	It is a warning that shows the moving gear system.
	It's a warning that indicates "do not intervene" to sensor. It determines the reference point of the sensor, it does not go to the correct reference and prevents the machine working regularly if the adjustment is broken.
	Air hose connection warning.

 	Hot zone warning
	Read the air filter change and cleaning instructions.
	Air regulator notification, read the necessary instructions.
	Do not open the door while machine running! Robot can hit !
	There's a danger of finger jamming.
	There is a danger of hotmelt splashing.
	Obligation to wear safety goggles.

	The necessity to wear protective gloves.

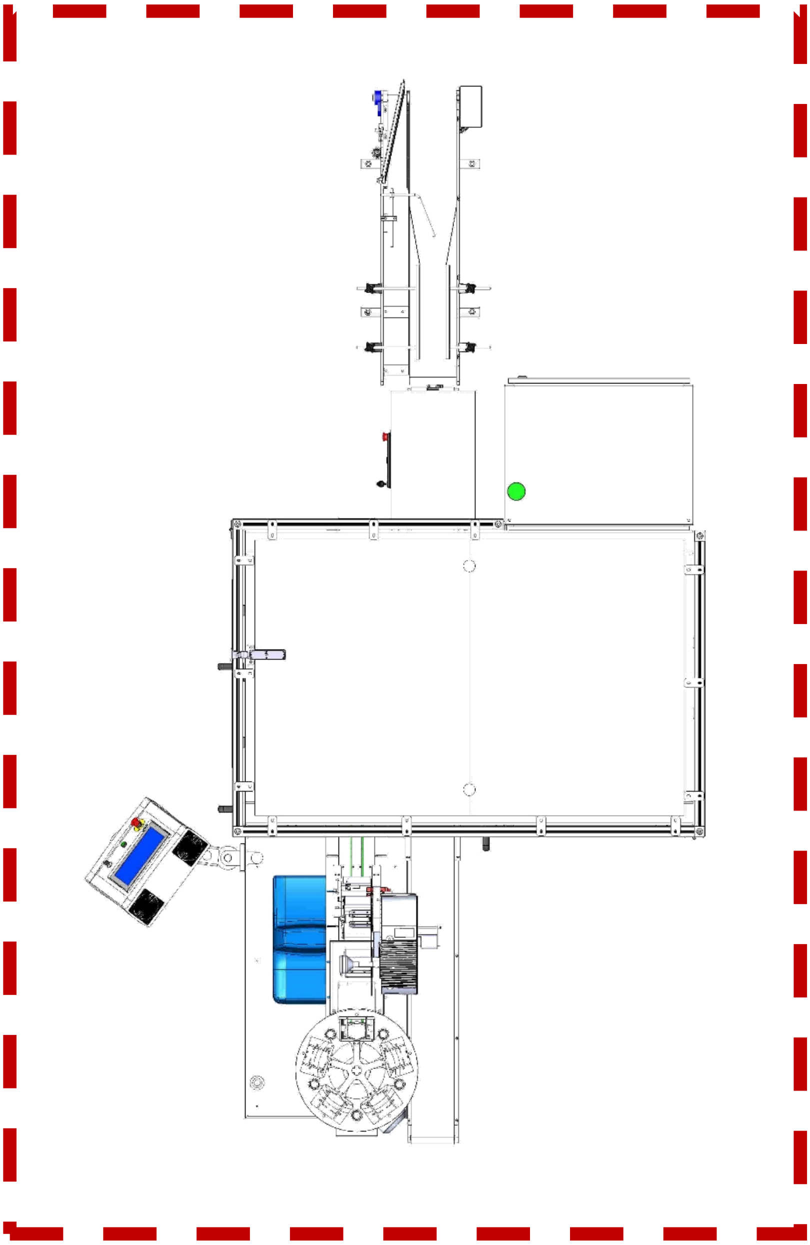
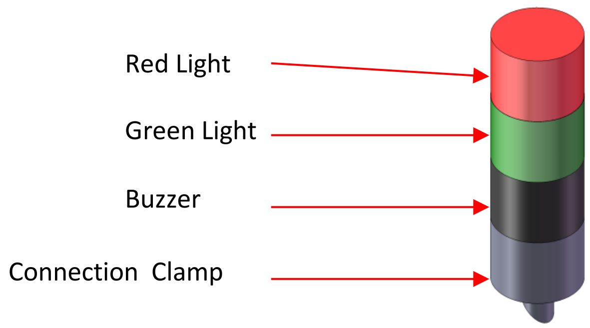
MACHINE OPERATING AREA



1 METER OPEN AREA MUST BE LEFT IN THE REGION WHERE STRIP IS DRAWN AROUND THE MACHINE. AN OBJET TO PREVENT OPERATING SHOULD NOT BE PLACED. OTHERWISE, IT CAN RISK BUSINESS SECURITY.

TOWER LIGHT INDICATOR (WARNING SIGNALS EXPLANATIONS)



RED LIGHT: This light is on when;

There is a malfunctioning device during operation

In case of any malfunction in any electric equipment and component

In any alarm message situation

GREEN LIGHT: This light is on when;

When all functions are normal and the machine is in the start (operating) position.

BUZZER: In the situations which may cause to turn on red light, the buzzer turns on with red light and makes warning sound. Besides, it warns the machine before starting to operate.

RED – GREEN LIGHT: When there are warnings and alarms that the machine does not need to stop, buzzer alarms with red light. After that, when the operator resets the alarm from the moving panel screen, the buzzer is deactivated and the red - green warning lights continue to light together.

MACHINE ALARM LIST

INCOMING WARNING MESSAGES	THINGS NEED TO BE DONE
Recipe name is not written	Write and enter the recipe name
Wrong Password	Please check the password
Passwords incompatible	Please check the password
Password cannot be empty	Please enter the password
Password changed	It indicated that the password changed
Manual Mode Necessary	Adjust the machine in Manual Mode from the Control Panel.
There is a malfunction on robot	Please check robot malfunctions
Auto Mode Necessary	Adjust the machine in Manual Mode from the Control Panel.
Incorrect Cycle Type Chosen	Please check the Cycle Type
Input Con. Inv.Error	Check Inverter Connection Cables and Parameters
Product Con. Inv.Error	Check Inverter Connection Cables and Parameters
Charger Inv.Error	Check Inverter Connection Cables and Parameters
Cycle Active	The Cycle is Active and this indicates that Certain Jobs will not be performed in this case.
Platform Locked	Unlock the Platform
Charger Lid Opened	Please close the charger cover
Emergency Stop	Please check the Emergency and install the pressed ones.
Air Pressure Point	Please check if there is air in the system.
Labelling Machine-1 Alarm	View the alarm from Labelling Machine, Reset alarm, Reset the Labelling Machine.
Labelling Machine-2 Alarm	View the alarm from Labelling Machine, Reset alarm, Reset the Labelling Machine.
Charger cover did not close	Please check the Charger Lid Piston and Sensor.
Charger Lock did not open	Please be sure that the charger cover is closed. Please check the Charger Lid Piston and Sensor
Charger was not closed	Please check the Charger Lid Piston and Sensor.
Charger Lid was not closed	Please check the Charger Lid Piston and Sensor.
Servo Error	Check the Servo Surveillance Connections, Control the Servo Connection, Check if the power is on.
Not Servo-powered	Let the Servo power.
Lid Ref. Necessary	Please press the Lid Ref. button.

Incompatible Cover Condition.	
Lid Test Trial Limit Exceeded	Lid Conv. Indicates that the lid is not reached until the determined limit.
Lid couldn't progress	Please check the Lid Conv.
Enter the maintenance password	Enter the password
Glue Level Low	Put glue to the glue machine
NOK Package	Send package
No Lid	Put the lid on charger
Clean the Lids	Lids on exit should be clean before the reference.
Working Mode Changed in Active Cycle	Machine Changed Operator Cycle while Operating
Previously Requested	Indicates a Previously Created Request
Charger Not Active	Please activate the charger on the screen
Charger test trial limit exceeded	Indicates the lids are over and indicates lids stayed according to limit determined on system
Save Error	Indicates that it does not save
PLC-Robot Communication Error	See if Robot Cables Are Connected, if Connected Check the connections are right or not, If Continued Close the Robot and open again
Reset Necessary	Please reset the machine on Control Panel
Saving...	Indicates that it saves
Saved	Indicates that it is saved
Charger is not active. Continue?	When Charger is Not Active Charger is Moved Manually
Lids on charger. Continue?	Manually taken lids while lids on charger.
Lids on charger	Manually taken lids while lids on charger.
Robot Axis Out of Limit - Adjust Manually	Robot holders out of Limit. Necessary to be corrected manually
Door opened	Please close the door
Lid Charger Servo Referance Necessary	Please make Lid Servo Reference on the screen
Lid Charger Servo Positioning Error	There may have been any incidents on the machine. Because of this shows that it cannot position itself.
On charger slot there is lid. Not Available For Reference	While there is lid on charger exit slot, reference is tried to make.
Labelling Machine Alarm	From the Label Maker, Look for Alarm, Reset Alarm, Reset Label Maker.
Reject Bucket Full !	Indicates that Reject Bucket is Full
Glue Not Ready !	Activate the glue !
Reject Piston Leaks	Indicates that Reject Piston is Leaking. Please control the adjustments
NOK Package Limit Exceeded	Indicates that the determined package limit has reached.

- ☑ Measuring instruments used in machine operation must be appropriate to mm unit.
- ☑ Measuring instruments used in Nordson Hotmelt device must be appropriate to inch unit.
- ☑ There must be tools on the machine technician that you can quickly replace spare parts such as hex bolts, allen keys, flathead screwdrivers and a clean cloth that are suitable for adjusting.
- ☑ The operator must have bonnet with white colored hygienic clothes.
- ☑ Protective googles and protective gloves should be worn because of hotmelt usage.
- ☑ Do not wear protective glasses that will prevent vision.
- ☑ You should wear non-slip shoes.
- ☑ The arms of the outfit should not be abundant but collectable with tire.
- ☑ Jewelry, such as necklaces, rings, bracelets, should not be worn.

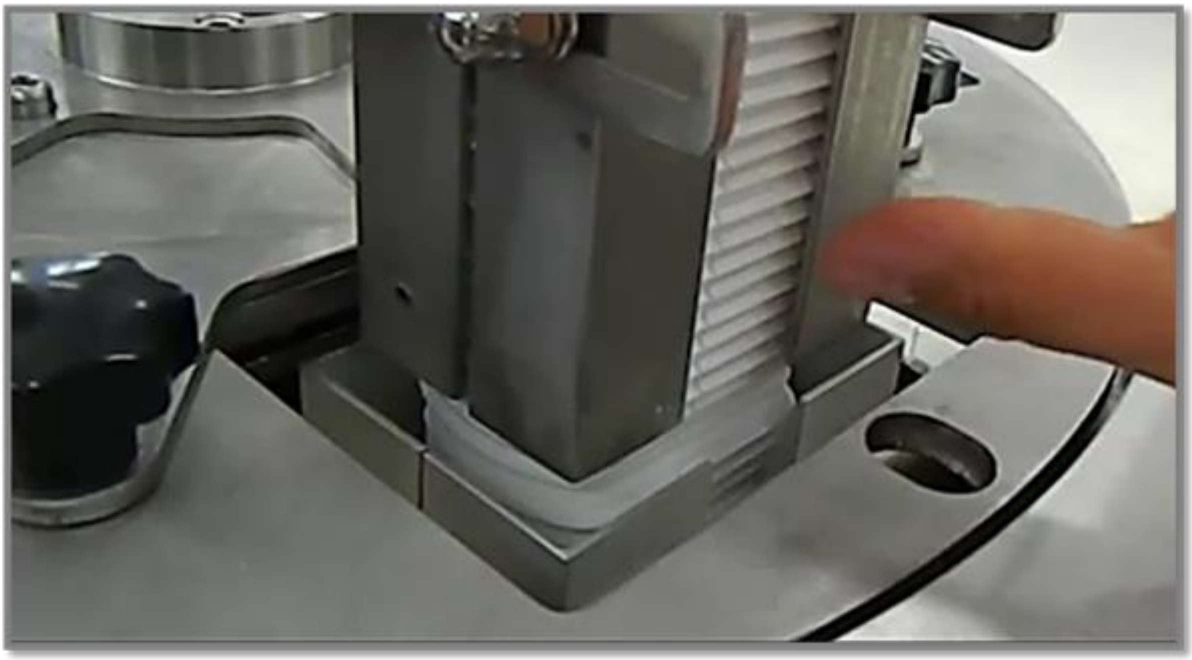
- ☑ **Do not operate the machine if there is an electrical gap anywhere in the machine.**
- ☑ **If there are any visible damage, do not use the machine and contact with the technician or manufacturer.**

Operating Schema of the Machine in Brief

- ➢ When the packages firstly enter to lid applicator machine, machine shoots with camera to check if the labels are on packages. The OPEN labels of the packages entering the machine must be definitely at above.
- ➢ The lids come out one by one from the lid accumulation cartridges on the lid conveyor and go to the robot area in order to be stucked labels while moving on conveyor.
- ➢ The lids are held in pairs by the robot and are rotated from the hotmelt nozzle to be ready.
- ➢ In incoming packages, the camera transfers the information of the labels to the robots, and according to this information, the robots stick the lids on the appropriate positions.

PART 4: MACHINE ADJUSTMENTS

BUFFER& LID CARTRIDGE ADJUSTMENT



Buffer and lid cartridges must be on same axis.

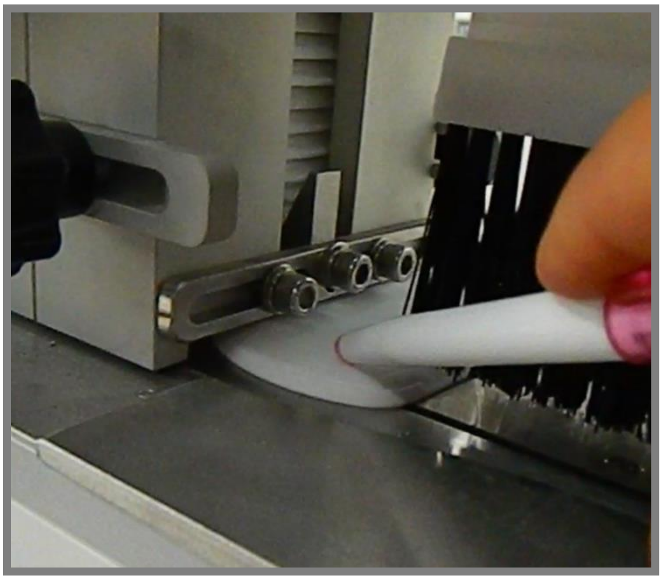
The buffer lids distances should be spaced about 4mm from the edges so that the lids can be easily fallen.

For the lids easily movement on the cartridge, it should be 2 mm between the cartridge and the lid from edges.

Buffer and lid cartridges must be on same axis.

The buffer lids distances should be spaced about 4mm from the edges so that the lids can be easily fallen.

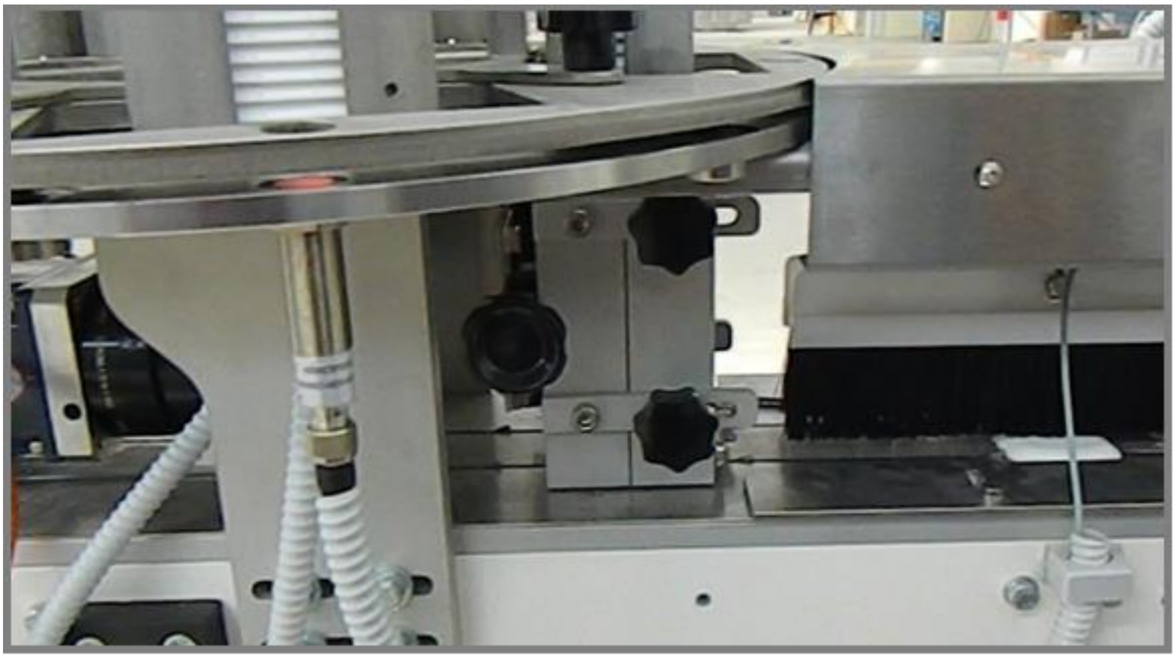
For the lids easily movement on the cartridge, it should be 2 mm between the cartridge and the lid from edges.



On buffer adjustment, it should be adjusted so that there is 2 mm gap around the lid.

After making these adjustments, height adjustment should be done so that only one lid is removed from the buffer output of the lids.

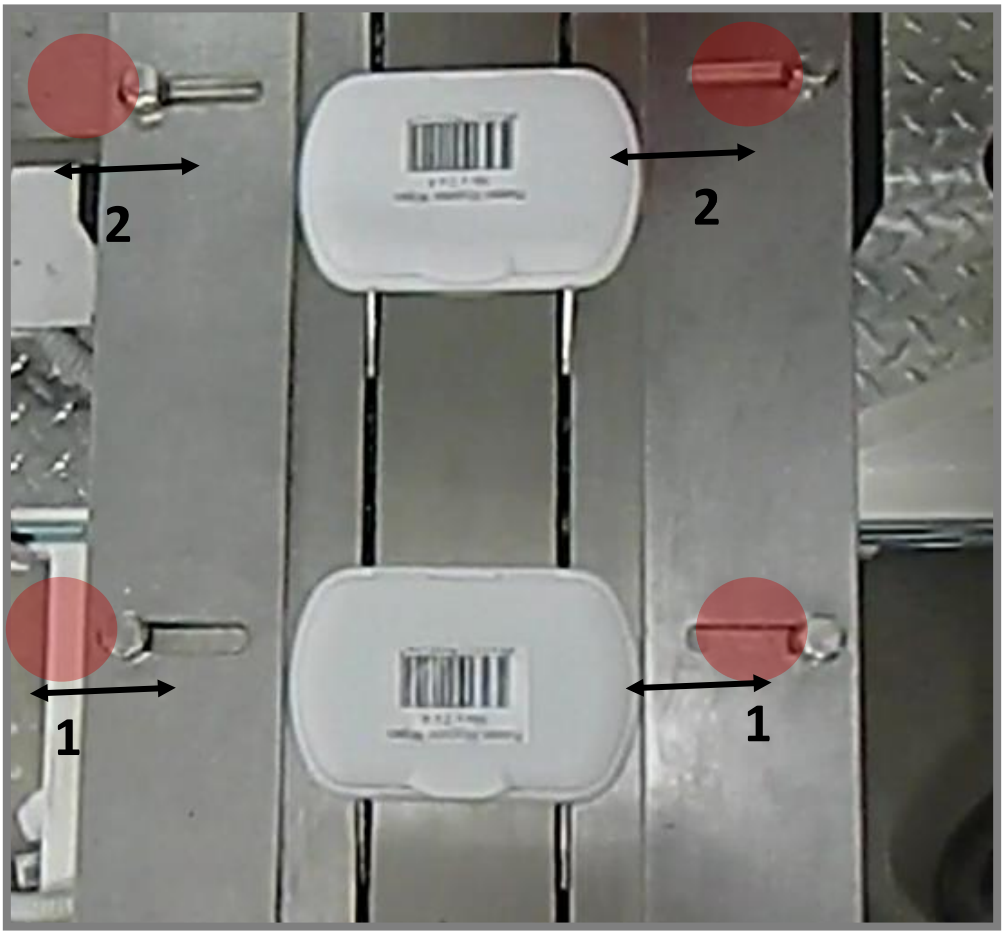
** The single lid should come out as shown in the picture. The marked area needs to be adjusted according to this.



Sensors located in the buffer provide the communication of lid completion,

The sensor on the lid cartridges checks if there are lids on cartridge. When it realizes that the lid is missing, it calls the next cartridge. It continues until finding lid and automatically supplies the lid.

LID CONVEYOR SIDE LEANING ADJUSTMENT



The side leanings should be adjusted with 0.5mm space for the lids.

As you can see in the picture, the bolts in the leaning are loosened. (1)

The loosened bolts must be tightened again after the adjustment is made. (2)

LABEL POSITION AND SENSOR ADJUSTMENT

1

2

3

The label must always be at the end of the plate which is underneath label because of its working principle.

The possibility of adjusting the position of the label on the plate is achieved with the help of the sensor as you can see in Picture 1.

The sensor detects the gap between the two labels and adjusts the position on the plate.

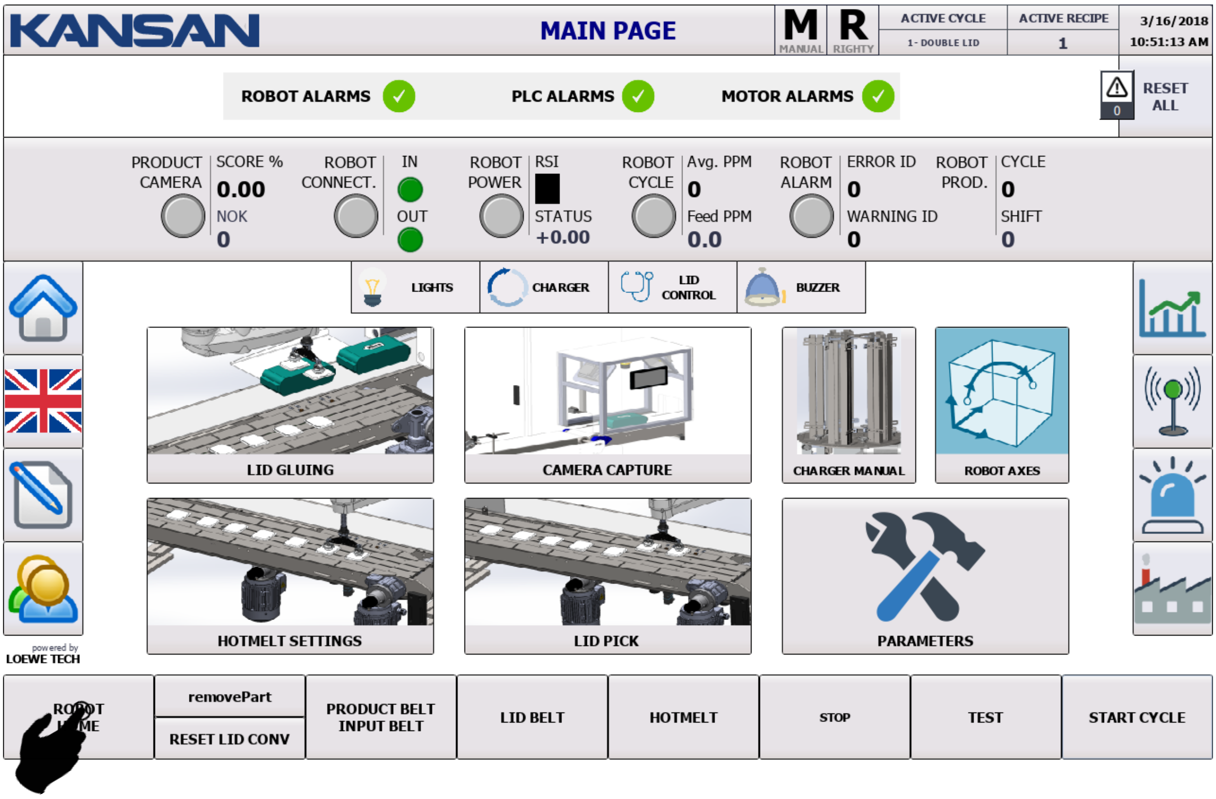
If the labels are left behind as in the picture, the sensor can be adjusted slightly down.

If the labels are at the front as shown in the picture, the correct position of the labels can be adjusted by sliding the sensor slightly upwards from its position.

STICKER ADJUSTMENT

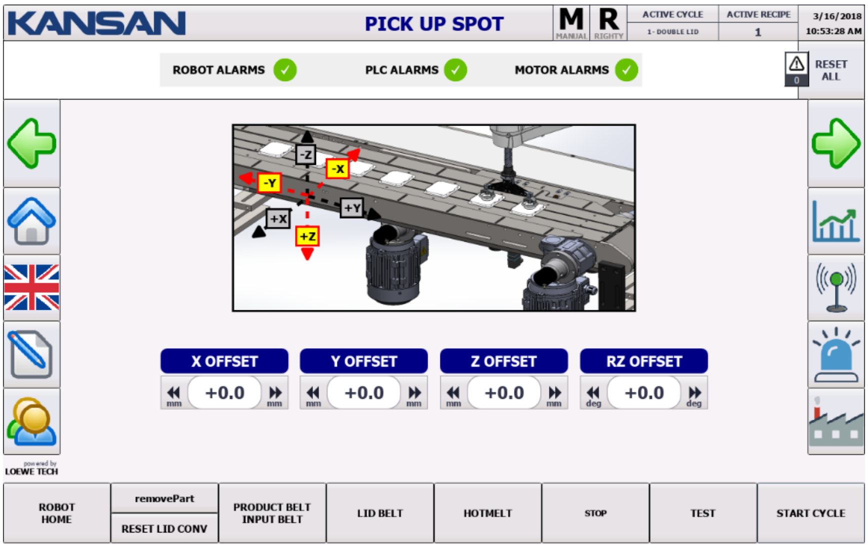
The sticker position should be aligned between the two soldering points.

ROBOT REFERANCE(HOME) POINT/ LM PRO

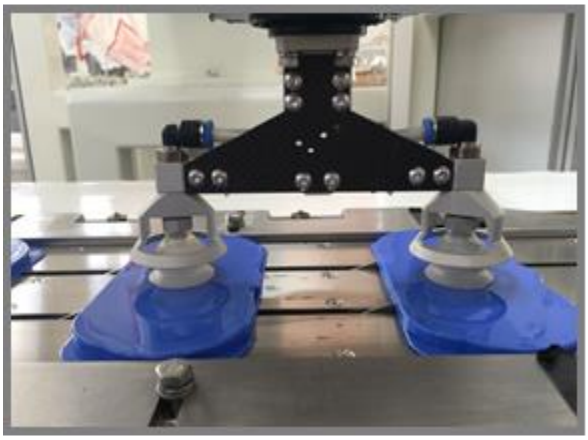


If the robot is referenced, it goes to the taught point (home) and remains there.This point registered in the system can not be changed from the control panel.

LID PICK TEACHING ADJUSTMENT/ LM PRO

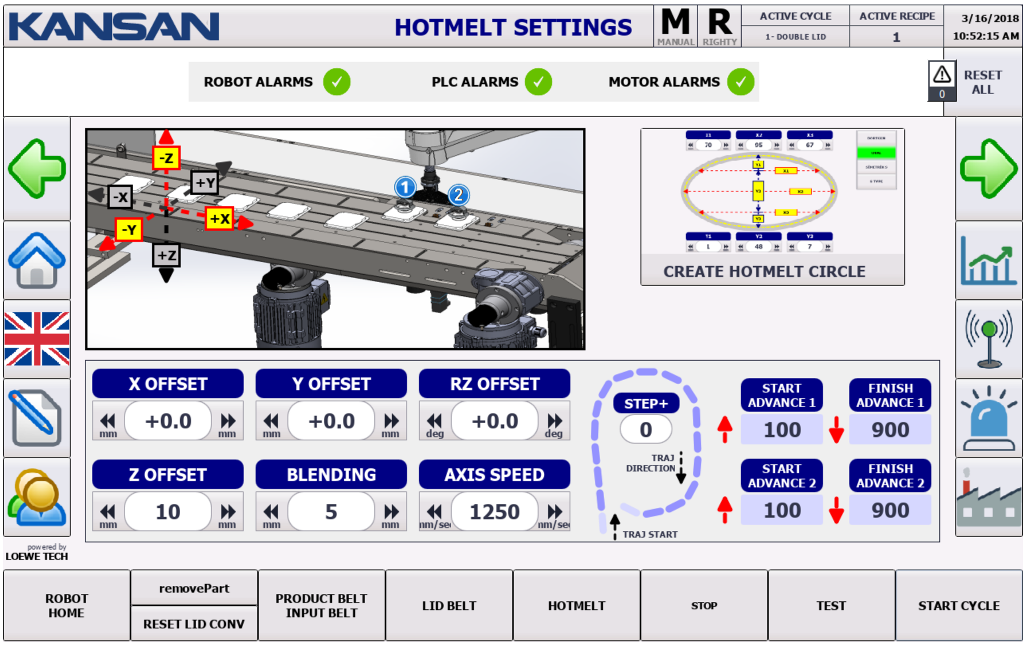


Lid take positon is taught on this screen.

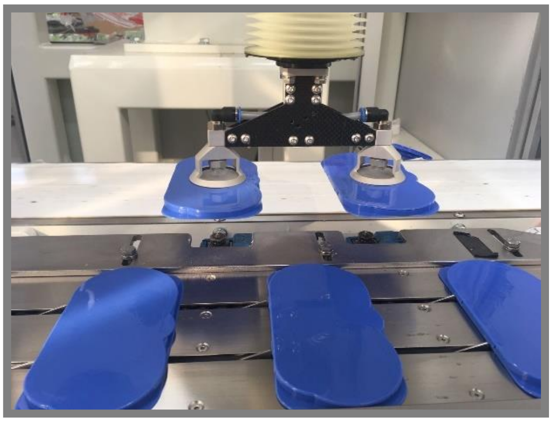


Adjust the vacuum nozzles so that they are in the center of the lid.

HOTMELT TEACHING ADJUSTMENT/ LM PRO

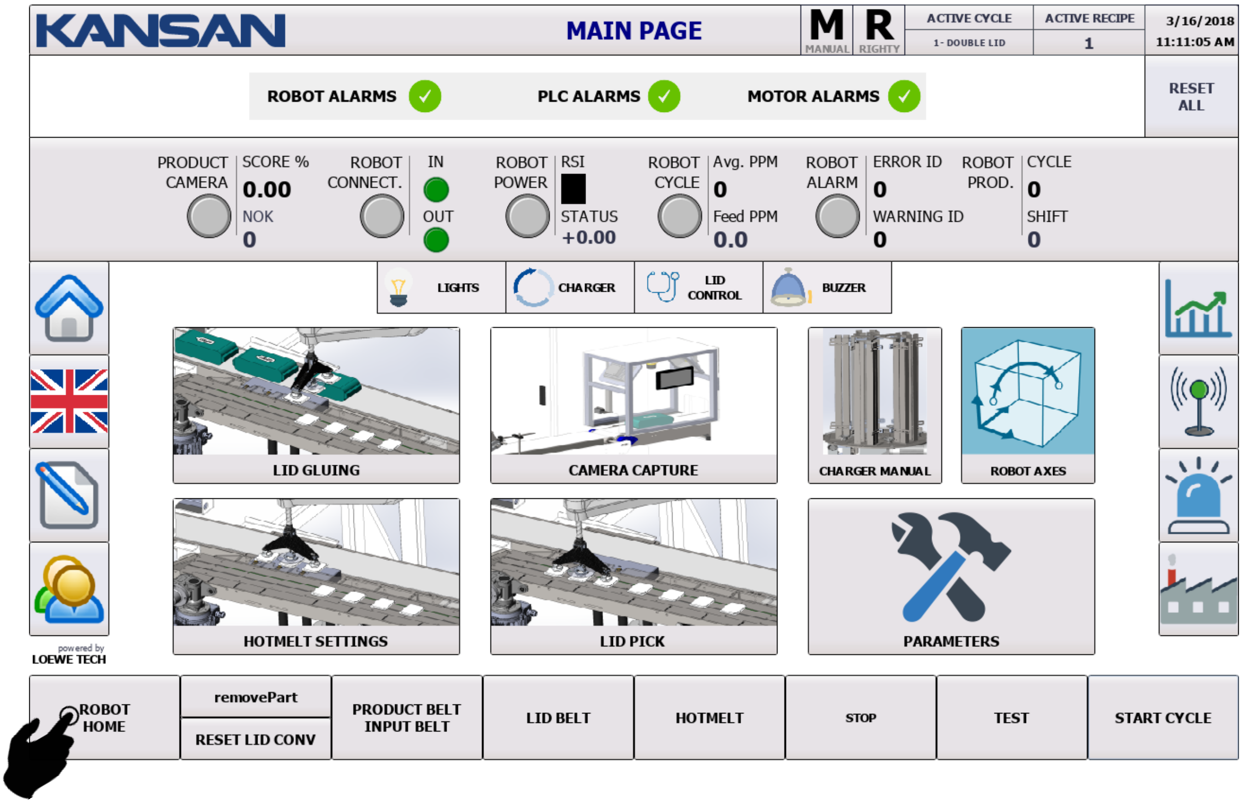


The hotmelt ejecting center is taught for the lid.



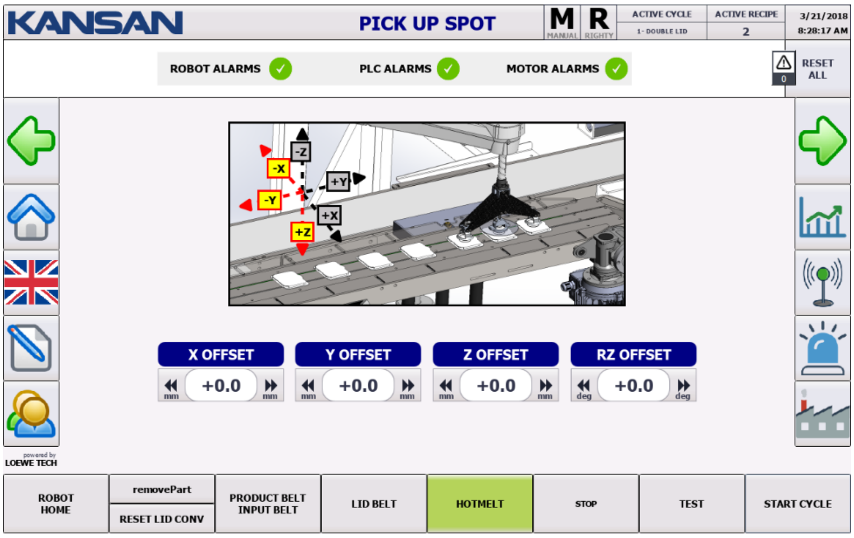
The lid is centered on the hotmelt nozzles.

ROBOT REFERANCE(HOME) POINT/ LM PRO+

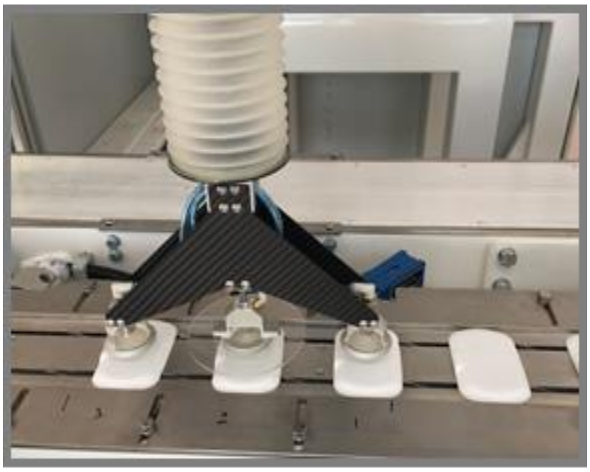


If the robot is referenced, it goes to the taught point (home) and remains there.
This point registered in the system can not be changed from the control panel.

LID PICK TEACHING ADJUSTMENT/ LM PRO+

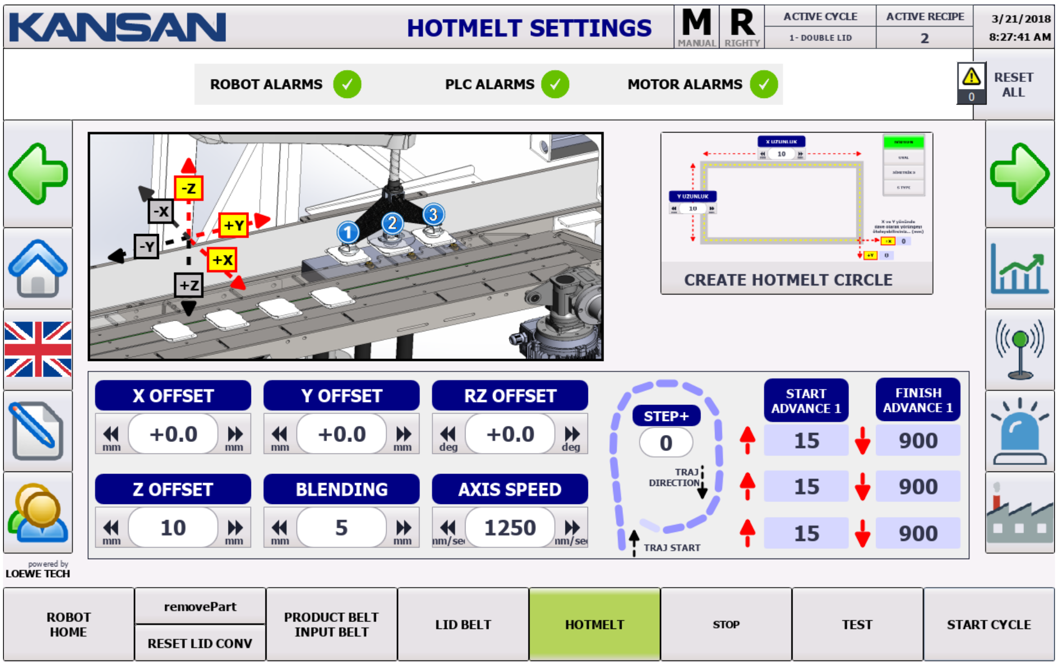


The lid pick position is taught on this screen.

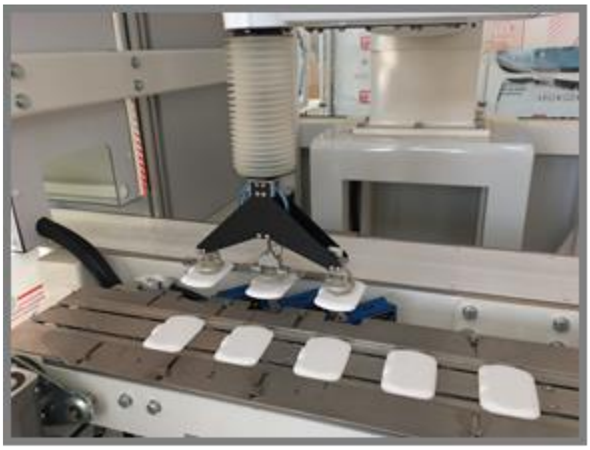


Adjust the vacuum nozzles to be at the center of the lid.

HOTMELT TEACHING ADJUSTMENT/ LM PRO+

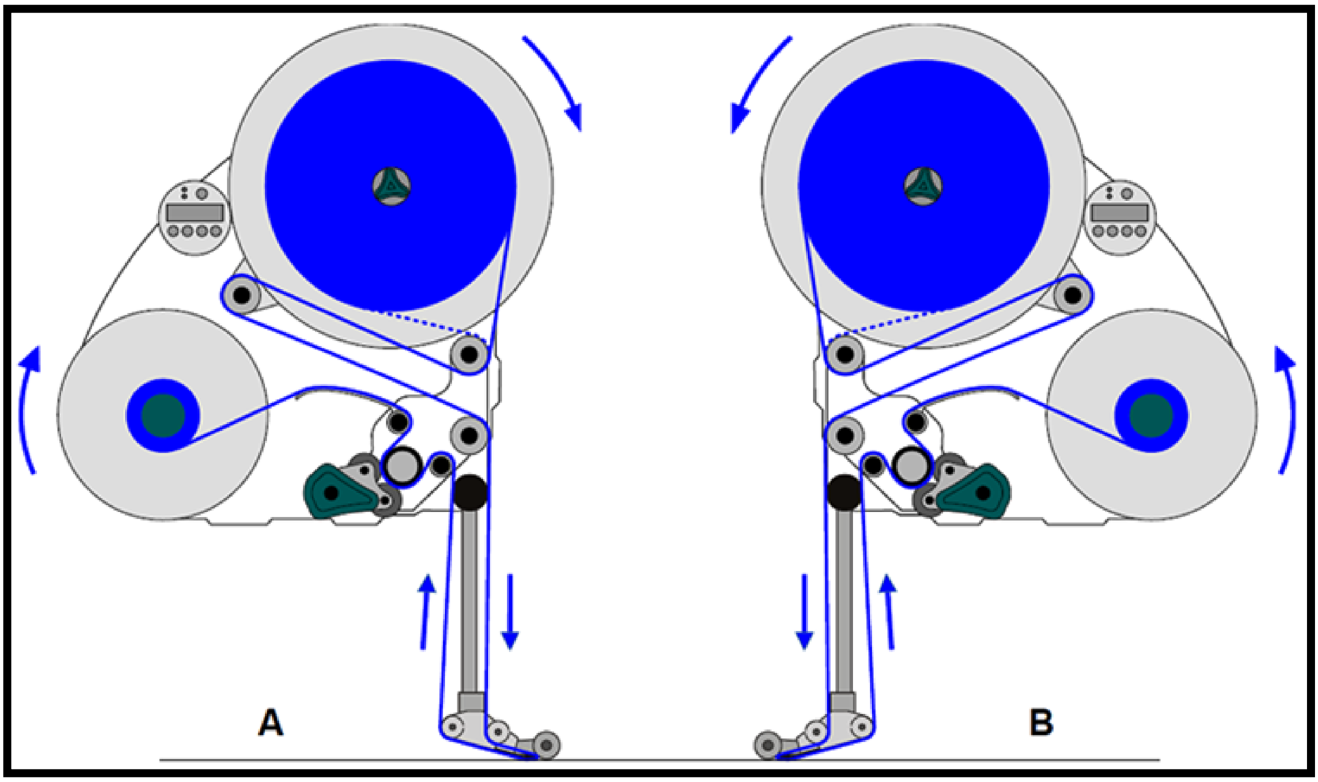


Hotmelt ejecting center is taught for lid.



The lid is centered on the hotmelt nozzles.

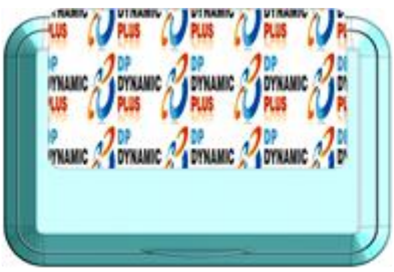
LABEL UNIT ADJUSTMENT AND LABEL POSITION CONTROL



A) RIGHT LABELLING UNIT PAPER TRANSFER SCHEMA

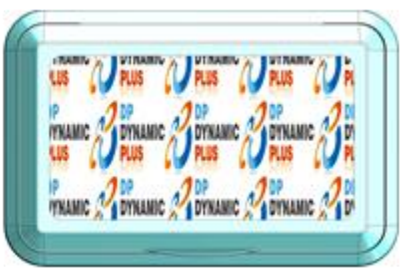
B) LEFT LABELLING UNIT PAPER TRANSFER SCHEMA

AVERY DENNISON Please check the user manual for maintenance and repair.

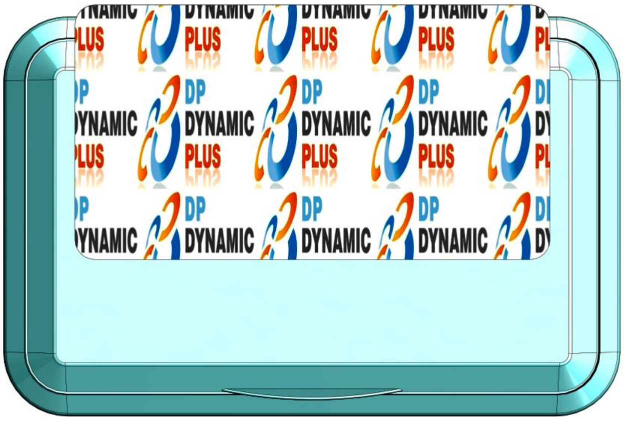


WRONG

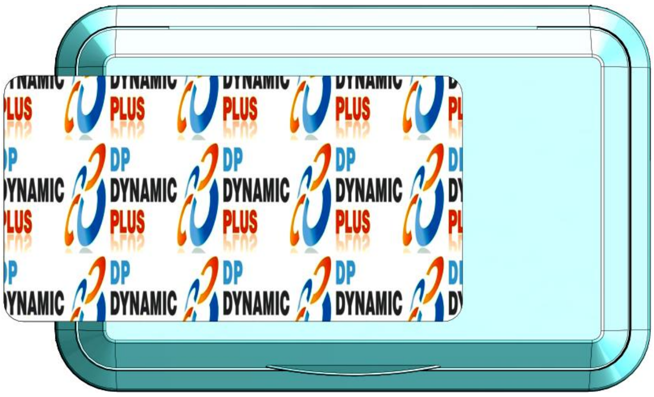
WRONG



RIGHT



If the label sticks loose on the "Y" axis on the lid, you can find the solution by changing the parameter on offset page from the label on the screen. The parameter value must be lowered if the label is farther away, and the parameter value should be raised if the label is behind.



If the label sticks loose on the "X" axis on the lid, it is adjusted by sliding the label unit back and forth with the help of the bakelite as shown in the right picture.

Z Axis Offset Adjusting: This is where the offset settings on the Z axis of the lid are made.

Rz Offset Adusting: The Angle-Offset settings on the Z axis of the lid are made here.

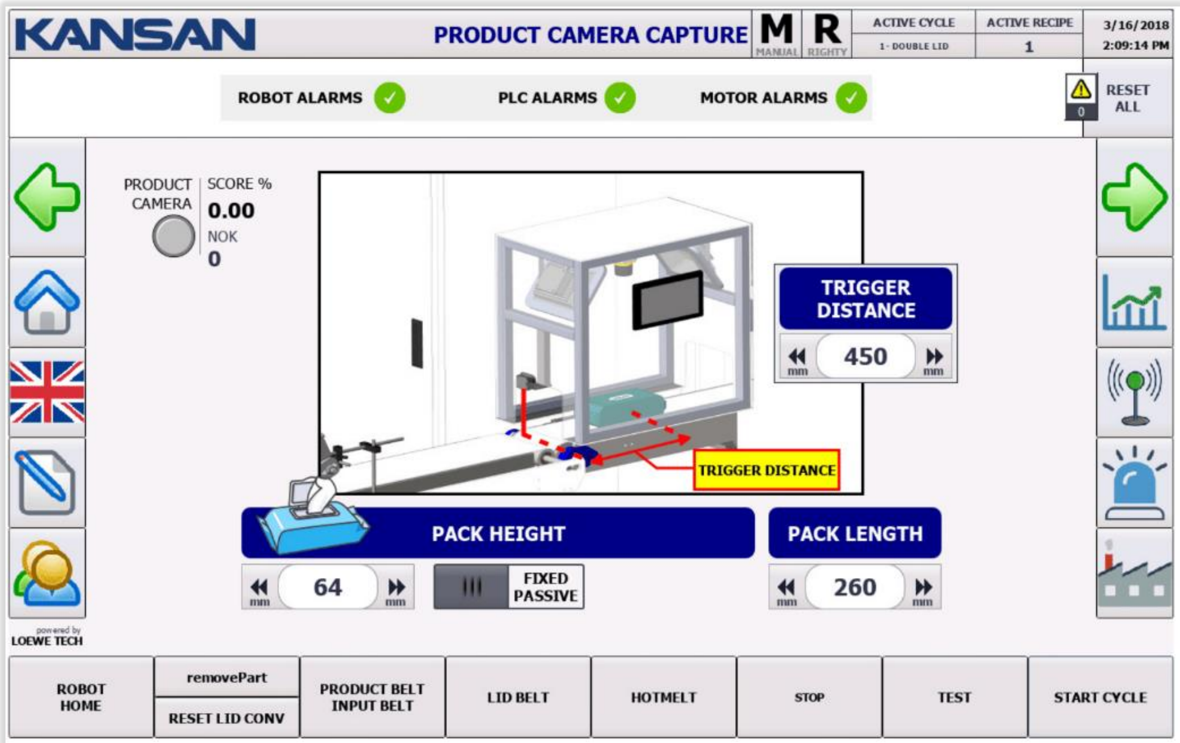
Blow Advance: The robot enables the blower to be active on any percentage of the distance that robot is approaching when it closes to vertically for gluing the package.

PRODUCT CAMERA CAPTURE SETTINGS

Instructions for the operator to display "PRODUCT CAMERA CAPTURE SETTINGS"

Press the sign  on left of screen.

Incoming Screen



SETTINGS WHICH CAN BE MADE BY OPERATOR ON "PRODUCT CAMERA CATCHING SETTINGS"

- ✓ **Package Height Adjustment**
- ✓ **Package Height Stable Passive**
- ✓ **Package Length Setting**
- ✓ **Trigger Distance Adjustment**

Package Height Adjustment: The adjustment which package height is defined.

Package Height Stable Passive: Automatic adjustment of the standard package height 64 mm - On / Off.

Package Length Setting: 64 mm, In Passive position: Panel is based on the value entered.

Package Length Setting: The adjustment which the package length measurement value is defined.

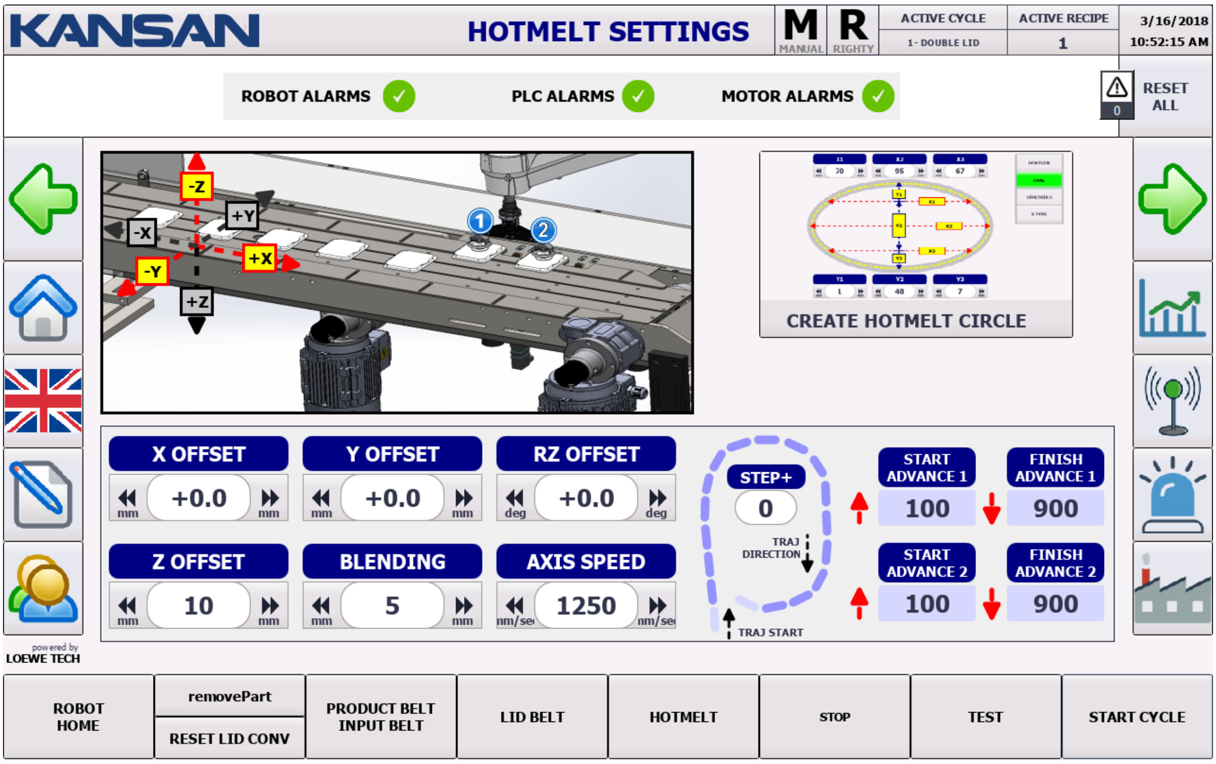
Trigger Distance Adjustment: This refers to the distance between trigger time and the first time which package was seen by sensor.

HOTMELT SETTINGS

Instructions for the operator to display the "HOTMELT SETTINGS" of the Operator

✓ Press the sign  → 
on left of screen.

Incoming Screen



ADJUSTMENTS WHICH CAN BE MADE BY OPERATOR ON HOTMELT SETTINGS

- ✓ **Hotmelt Circle Setting**
- ✓ **RealTime Opened/Closed**
- ✓ **Hotmel Circle Line Linear Active/Passive**
- ✓ **X Axis Offset Setting**
- ✓ **Y Axis Offset Setting**
- ✓ **Z Axis Offset Setting**
- ✓ **Rz Offset Setting**
- ✓ **Blending Setting**

- ✓ **Circle Speed Setting**
- ✓ **Starting Advance 1**
- ✓ **Finishing Advance 1**
- ✓ **Starting Advance 2**
- ✓ **Finishing Advance 2**

Hotmelt Circle Setting: Adjustment of circle setting.

RealTime Opened/Closed: If RealTime is in the Active situation, it calculates the circle according to the parameters; If it is off, it does not calculate.

Hotmelt Circle Line Linear Active/Passive: Expresses the movement mode of the circle.

X Axis Offset Setting: This is where the offset settings on the X axis of the lid are made.

Y Axis Offset Setting: This is where the offset settings on the Y axis of the lid are made.

Z Axis Offset Setting: This is where the offset settings on the Z axis of the lid are made.

Rz Offset Setting: Angle-offset settings of the cover's RZ axis are made here.

Blending Setting: It is the softening setting on crossing between points.

Circle Speed Setting: The circle speed is set here.

Starting Advance 1: 1. It is the value of the advance of the hotmelt. As it increases, the hotmelt delays the moment it begins to circle; As it begins to decrease, it takes the moment to earlier.

Finishing Advance 1: 1. The advance value belongs to hotmelt finishing . As it increases, hotmelt delays the circle ending; As it decreases the ending moment becomes earlier.

Starting Advance 2: 2. It is the value of the advance of the hotmelt. As it increases, the hotmelt delays the moment it begins to circle; As it begins to decrease, it takes the moment to earlier**.**

Finishing Advance 2: 2. . The advance value belongs to hotmelt finishing . As it increases, hotmelt delays the circle ending; As it decreases the ending moment becomes earlier.

HOTMELT CIRCLE SETTINGS

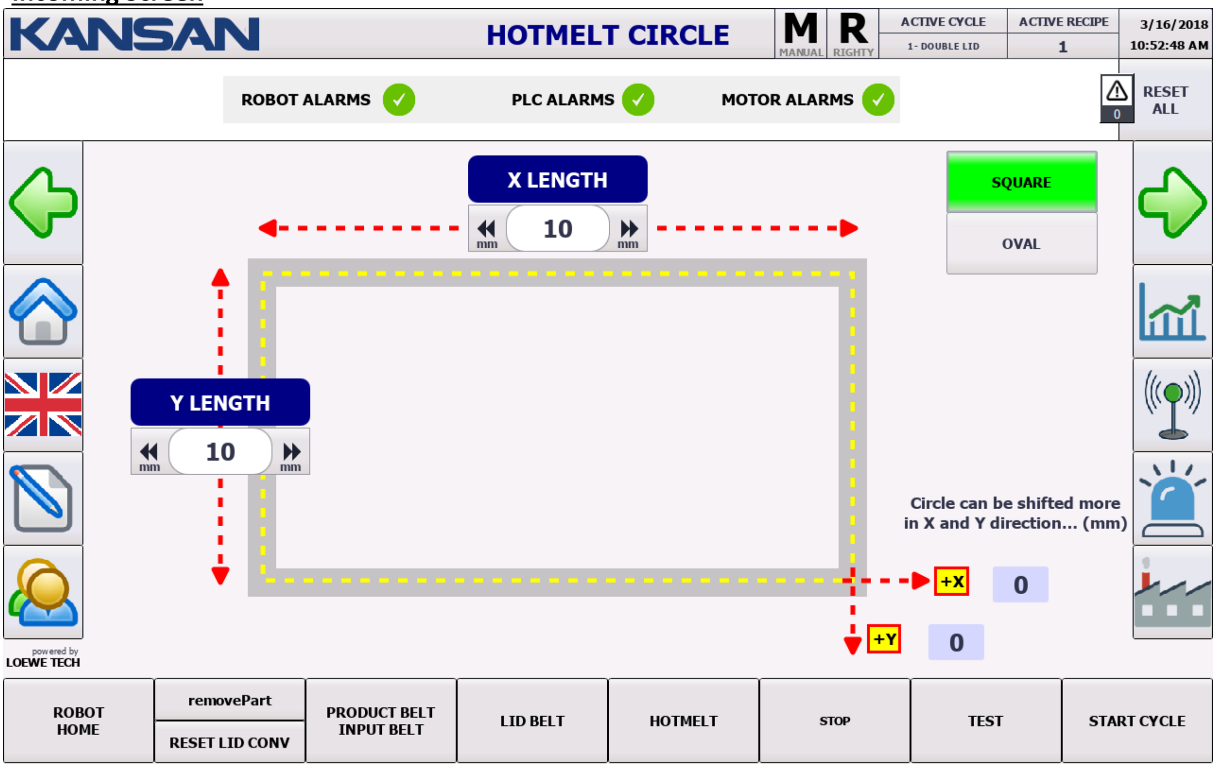
SQUARE LID

Instructions for the operator to display "HOTMELT CIRCLE SETTINGS"

✓ Press the symbol  → 
→ 
↓ 

On left of screen.

Incoming Screen



If the lid geometry is rectangular, adjustments are made here.

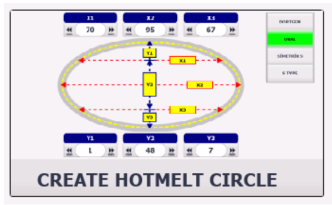
The length of the lid X and Y should be entered in this section.

HOTMELT CIRCLE SETTINGS

OVAL LID

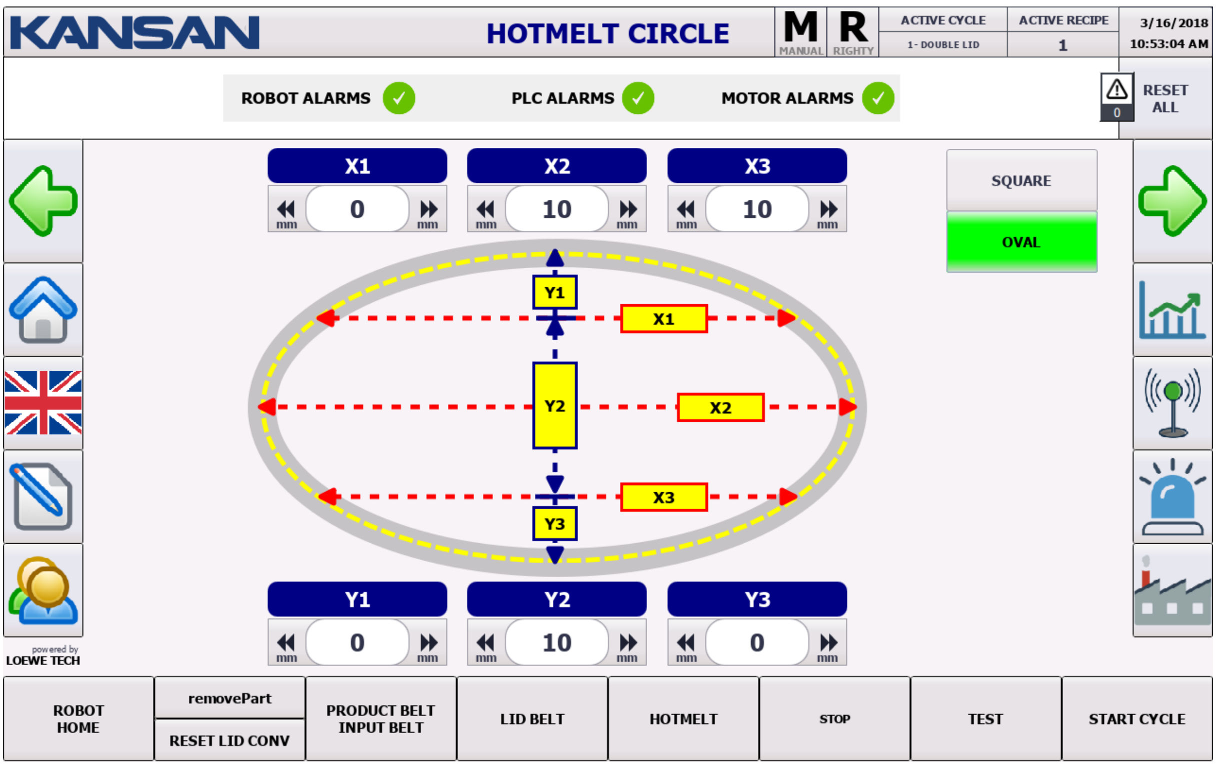
Instructions for the operator to display "HOTMELT CIRCLE SETTINGS"

✓ Press the symbol  



On left of screen.

__Incoming Screen__



If the lid geometry is rectangular, adjustments are made here.

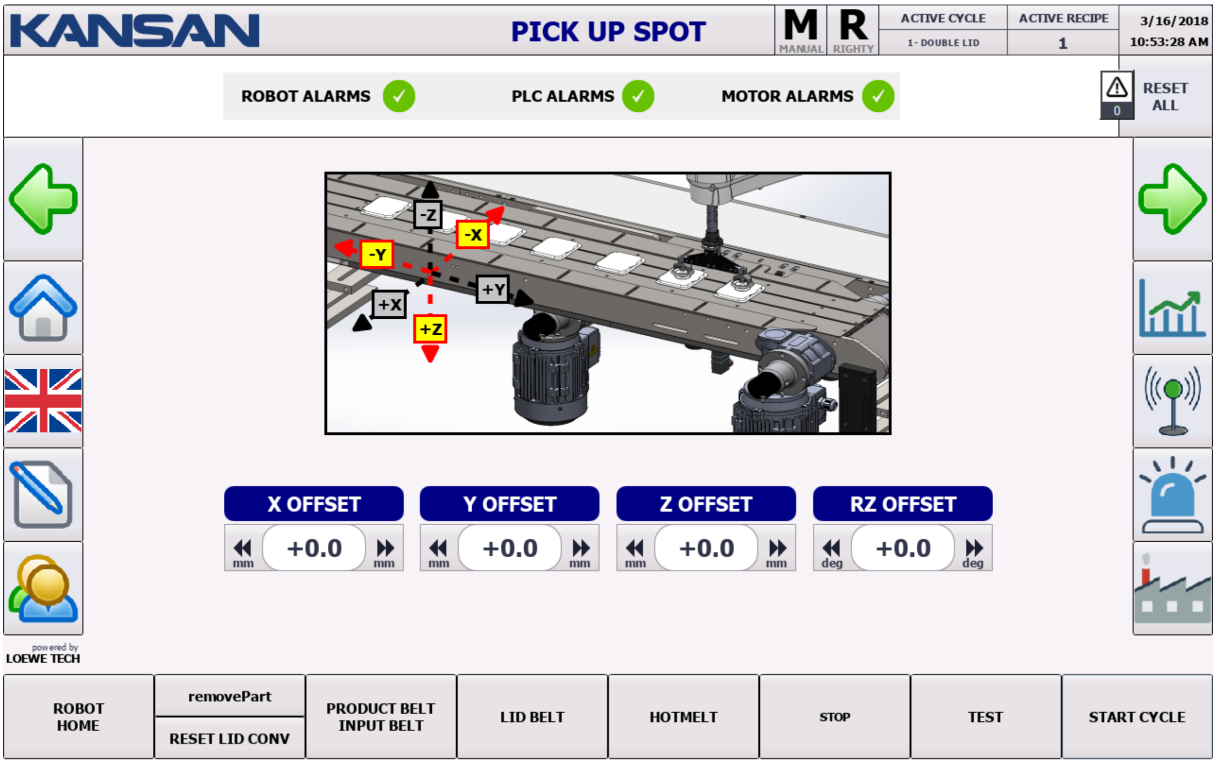
The values of the points forming the lid must be entered in this section.

LID PICK POINT

Intructions for the operator to display "PICK POINT SETTINGS" screen

- ✓ Press the symbol  → 
on left of screen.

<u>Incoming Screen</u>



ADJUSTMENTS THAT THE OPERATOR CAN MAKE IN GLUE SETTINGS

- ✓ **X Axis Offset Setting**
- ✓ **Y Axis Offset Setting**
- ✓ **Z Axis Offset Setting**
- ✓ **Rz Offset Setting**

X Axis Offset Setting: The offset settings on the robot X axis are made here.

Y Axis Offset Setting: The offset settings on the robot Y axis are made here.

Z Axis Offset Setting: The offset settings on the robot Z axis are made here.

Rz Offset Setting: The offset settings on the robot Rz axis are made here.

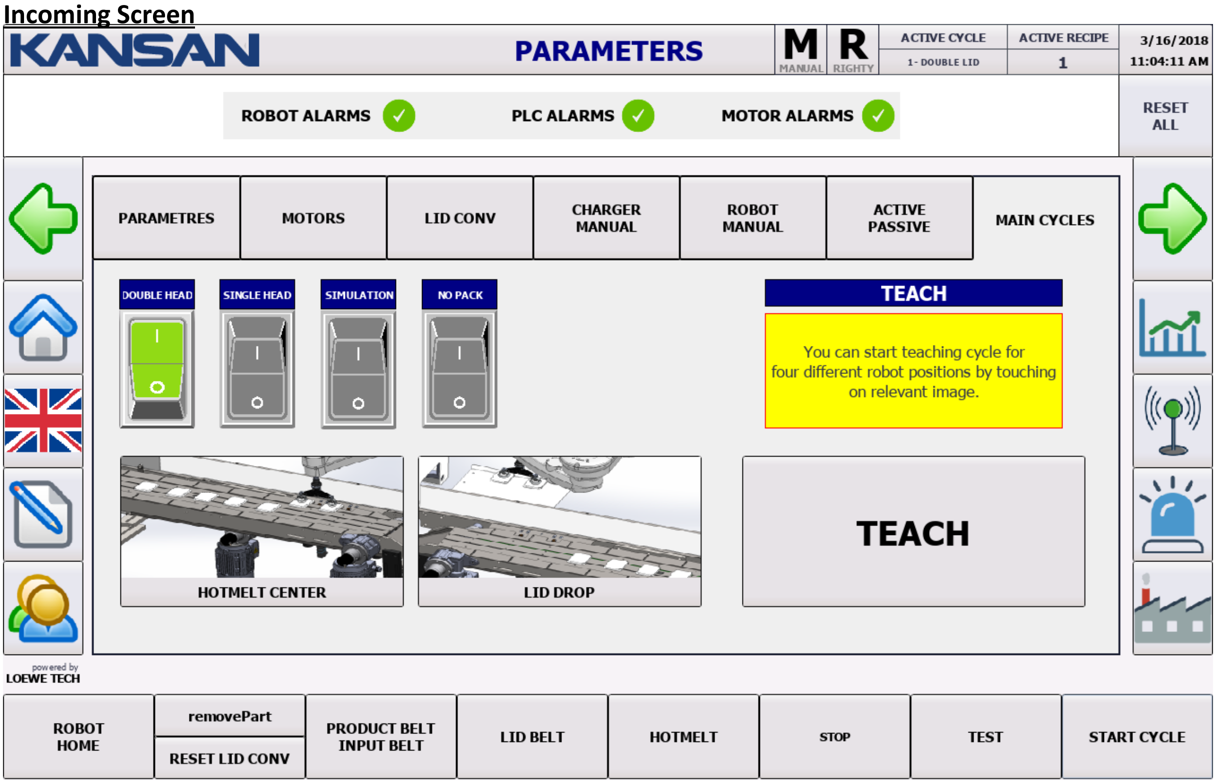
CYCLES

Instructions for the operator to display the “CYCLES” page

✓ Press the symbol  → 

→ 
on left of screen

Incoming Screen



ADJUSMENTS THAT OPERATOR CAN MAKE ON MAIN CYCLES SCREEN SETTINGS

It includes Main Cycles of the machine. On this page the main cycles of the machine can be activated / deactivated.

- ✓ **Three Head Operation On/Off**
- ✓ **SimPack On/Off**
- ✓ **SimPlace On/Off**
- ✓ **Unpacked Operating On/Off**

Three-Head Working On/Off: It provides Robot operating with three-head system.

SimPack On/Off: Simulates the picking point.

SimPlace On/Off: Simulates the dropping point.

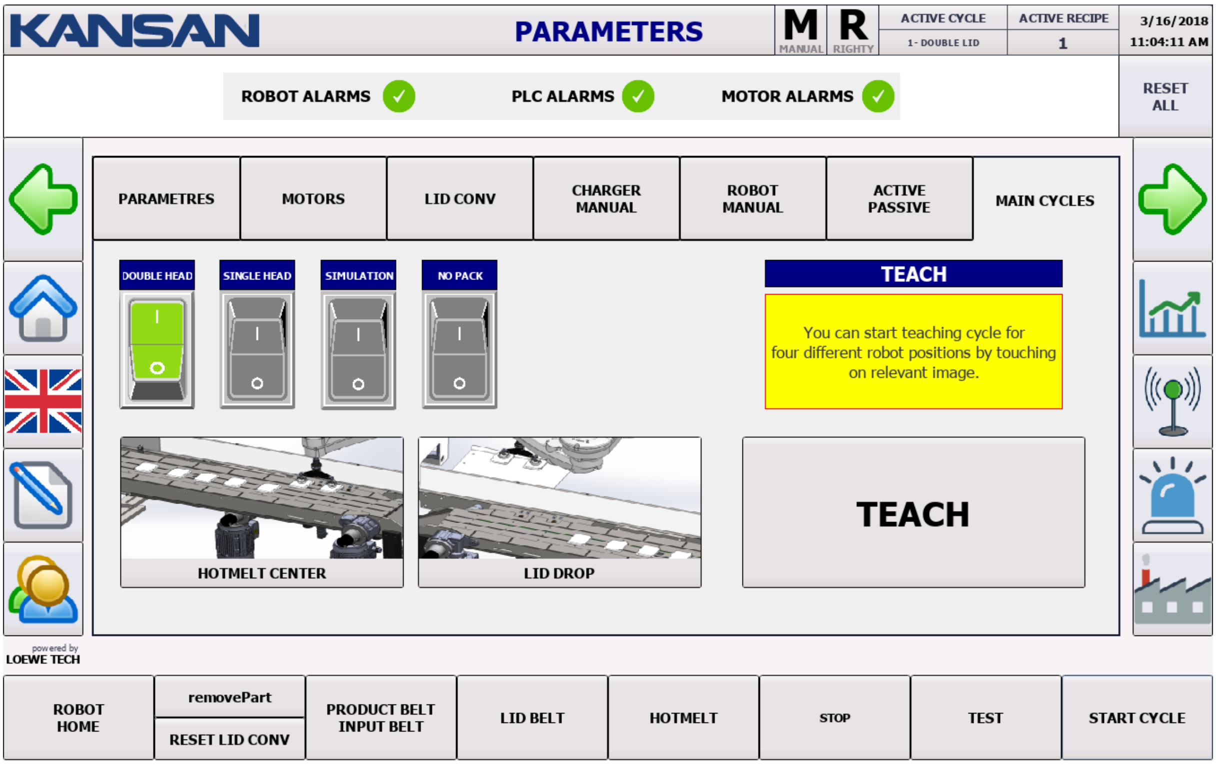
No pack Work On/Off: Allows machine to run without package.

TEACHING POINT

Instructions for the operator to display "TEACHIN POINT" screen

✓ Press the symbol 
On left of screen.

<u>Incoming Screen</u>



SETTINGS THAT OPERATOR CAN MAKE ON "TEACHING POINT" SCREEN

- ✓ **Hotmelt Center Teaching Setting**
- ✓ **Lid Dropping "Teaching Setting" (Authorized personnel can do.)**

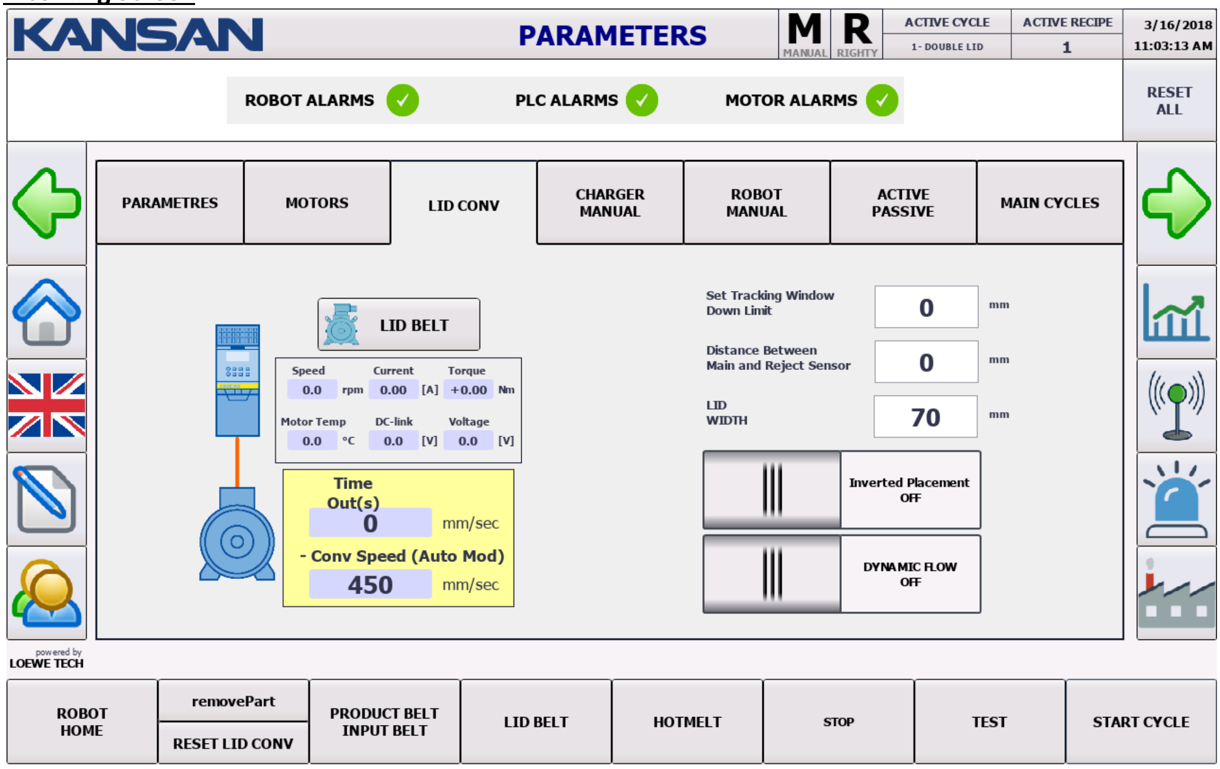
THE TEACHING BUTTON MUST ABSOLUTELY BE PRESSED WHEN THE PROTECTION DOOR IN CLOSED POSITION.

LID CONVEYOR

Instructions for the operator to display "LID CONVEYOR" page

✓ Press the symbol 
on lef of screen.

Incoming Screen



SETTINGS CAN BE MADE BY OPERATOR ON LID SERVO PAGE

- ✓ **Set Tracking Window Down Limit:** If necessary, conveyor changes Soldier Position to Positive (+) and Negative (-).
- ✓ **Distance Between Main and Reject Sensor:** It is the section where the distance value between Input and Output Sensors is entered.
- ✓ **Lid Width:** Value of Lid Width is entered here.
- ✓ **İnverted Placement:** It is the setting that the lid position can adjusted to Horizontal-Vertical On/Off.
- ✓ **Dynamic Flow:** It is the setting that Lid Conveyor and Product Conveyor speeds equalizing setting can be adjusted to On/Off.

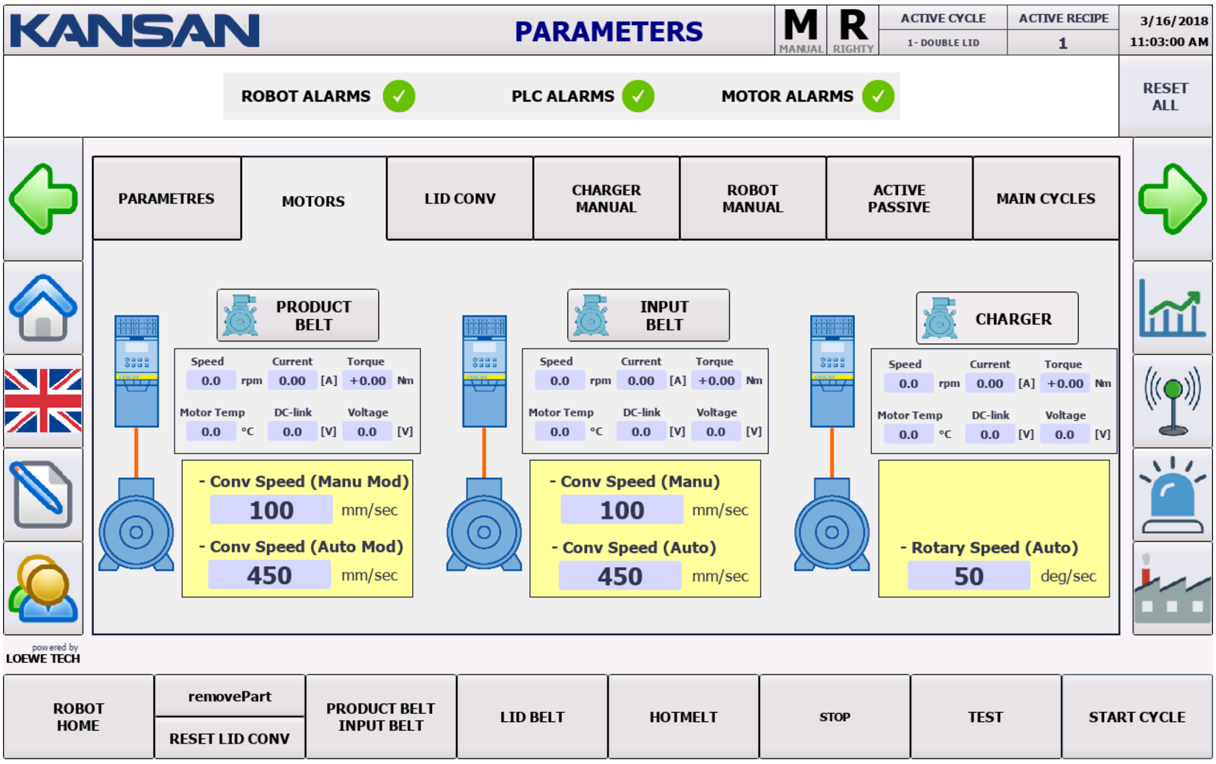
MOTORS

Instructions for the operator to display “MOTORS” screen

✓ Press the symbol  → 

→ 
on left of screen.

__Incoming Screen__



The screen displaying the status of the motors on the machine.

__Motors__

-Speed (Manual and Automatic Mode)

-Flow

-Tork

-Heat

-The screen that displays voltage values.

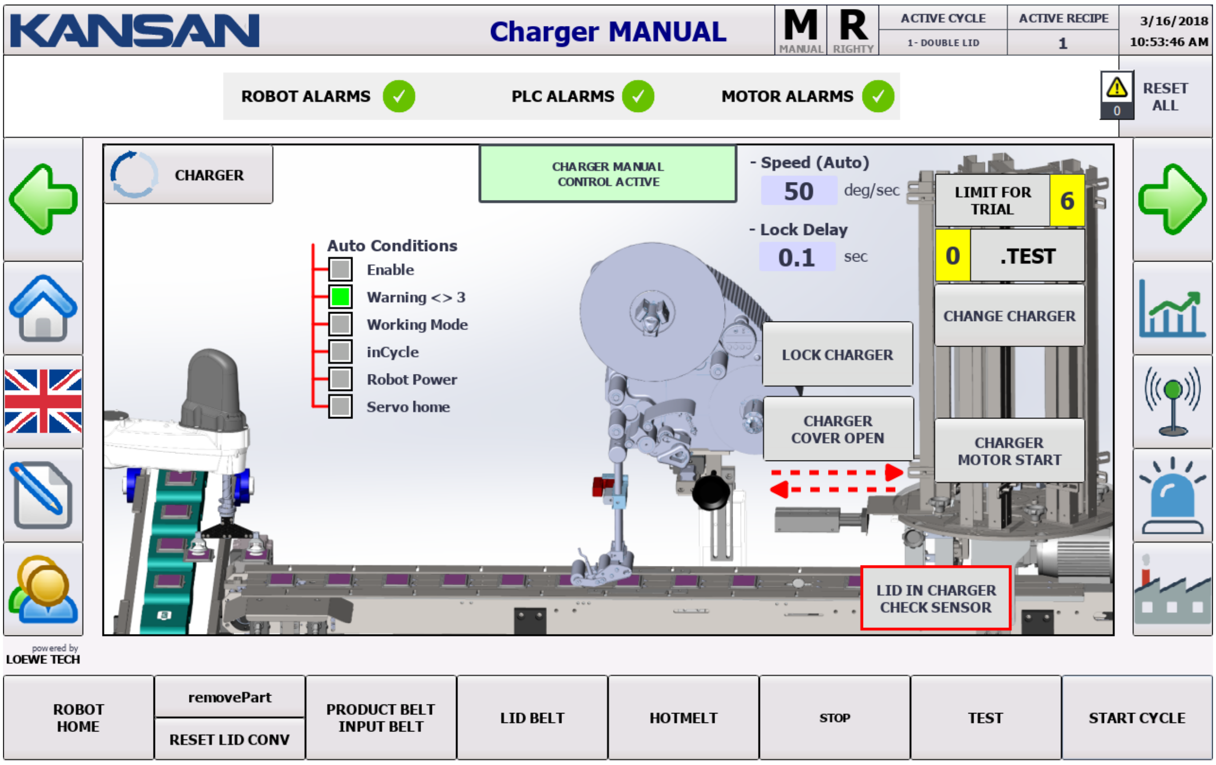
CHARGER MANUAL

Instructions for the operator to display "CHARGER MANUAL SCREEN" page

✓ Press the symbol  → 

on left of screen.

Incoming Screen



On this screen the status of the Charger can be checked. When the key on panel is in the Manual / Automatic position, the Operator can use 4 combinations on this page.

1. Machine on Manual + Charger Passive = CONTROL ACTIVE
2. Machine on Manual + Charger Active = CYCLE ACTIVE
3. Machine on Manual + Charger Active = TOTALLY PASSIVE
4. Machine on Manual + Charger Passive = TOTALLY PASSIVE

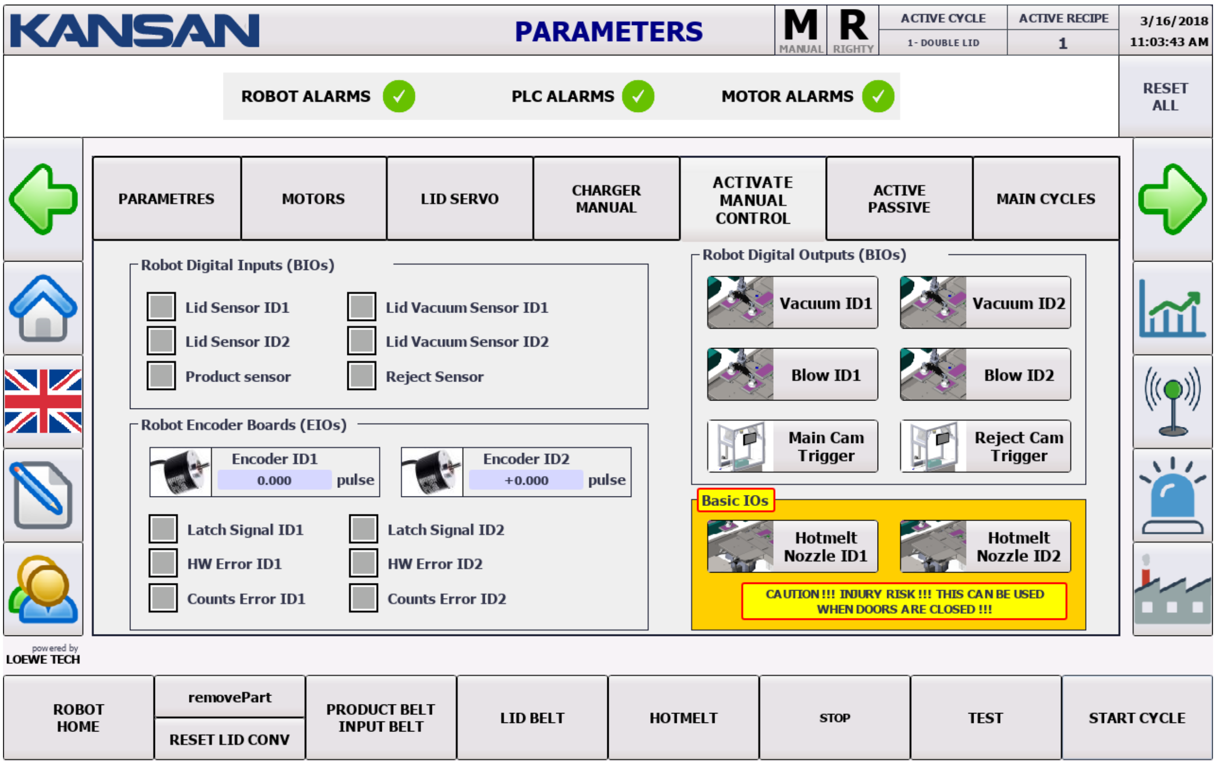
ACTIVATE MANUAL CONTROL

Instructions for the operator to display “ACTIVATE MANUAL CONTROL” page

✓ Press the symbol  → 

→ 
On left of screen.

Incoming Screen



Robot 1 and 2 Head Vacuum and Blow settings; Reject Cam Trigger and Main Cam Trigger settings are made here.

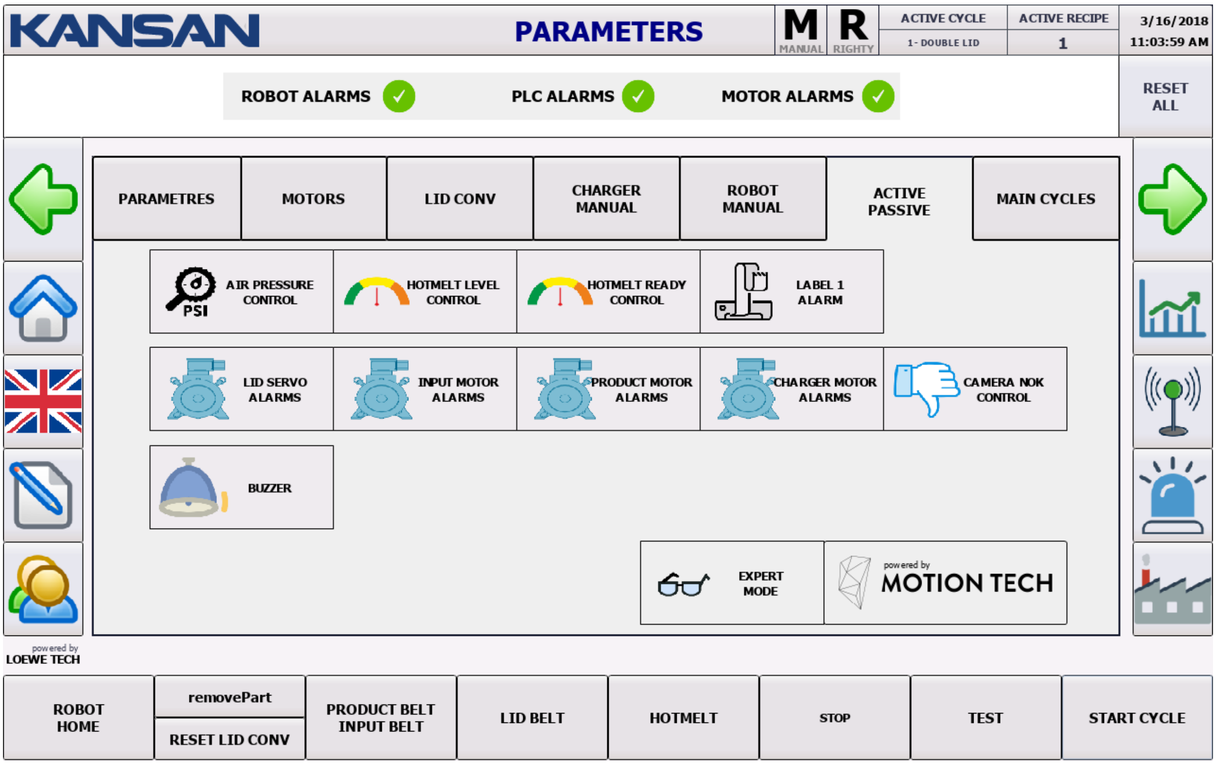
⚠ **The Protection Doors must be in the off position while performing these settings.** ⚠

ACTIVE / PASSIVE

Instructions for the operator to display "ACTIVE/PASSIVE" screen

✓ Press the symbol  →  on left of screen.

Incoming Screen



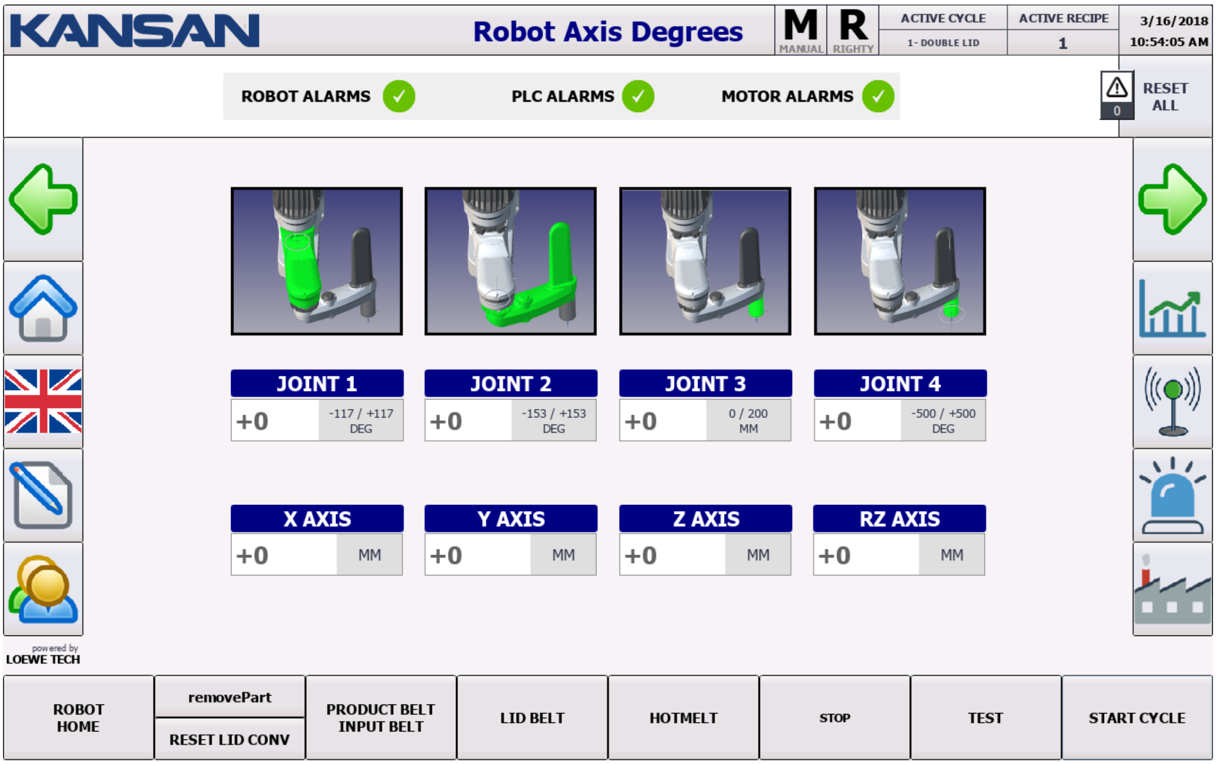
Features that can be set to Active / Passive on the machine are in this page.

ROBOT AXIS DEGREES

The instructions for the operator to display "ROBOT AXIS DEGREES" screen

✓ Press the symbol  → 
on left of screen.

<u>Incoming Screen</u>

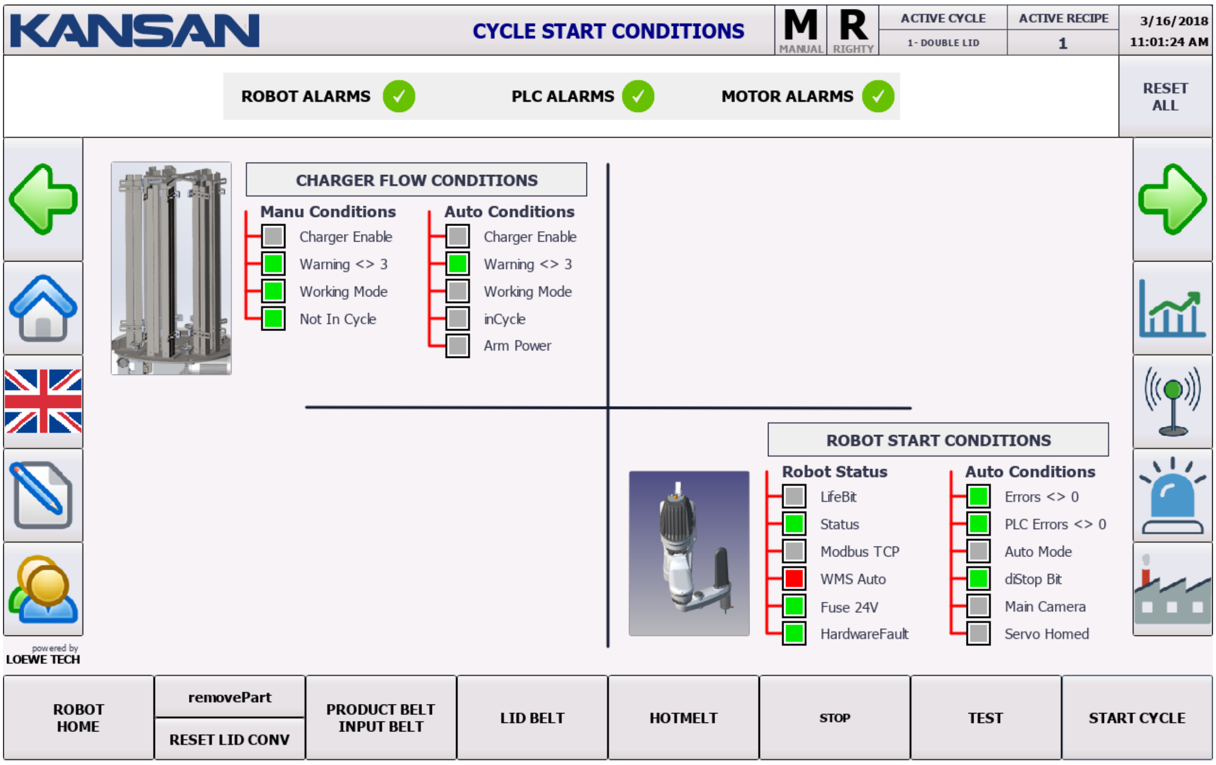


The current screen shows the robot axis angles and robot tool cartesian coordinates; displays the instantaneous information when the robot is not in the cycle.

CYCLE STARTING CONDITIONS

Instructions for the operator to display “CYCLE STARTING CONDITIONS” screen

✓ Press the symbol  →  on left of screen.

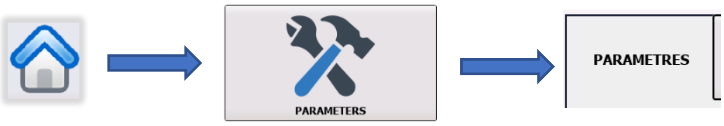


The status of preconditions which belongs to 2 cycles running in parallel is followed here.

SETTINGS

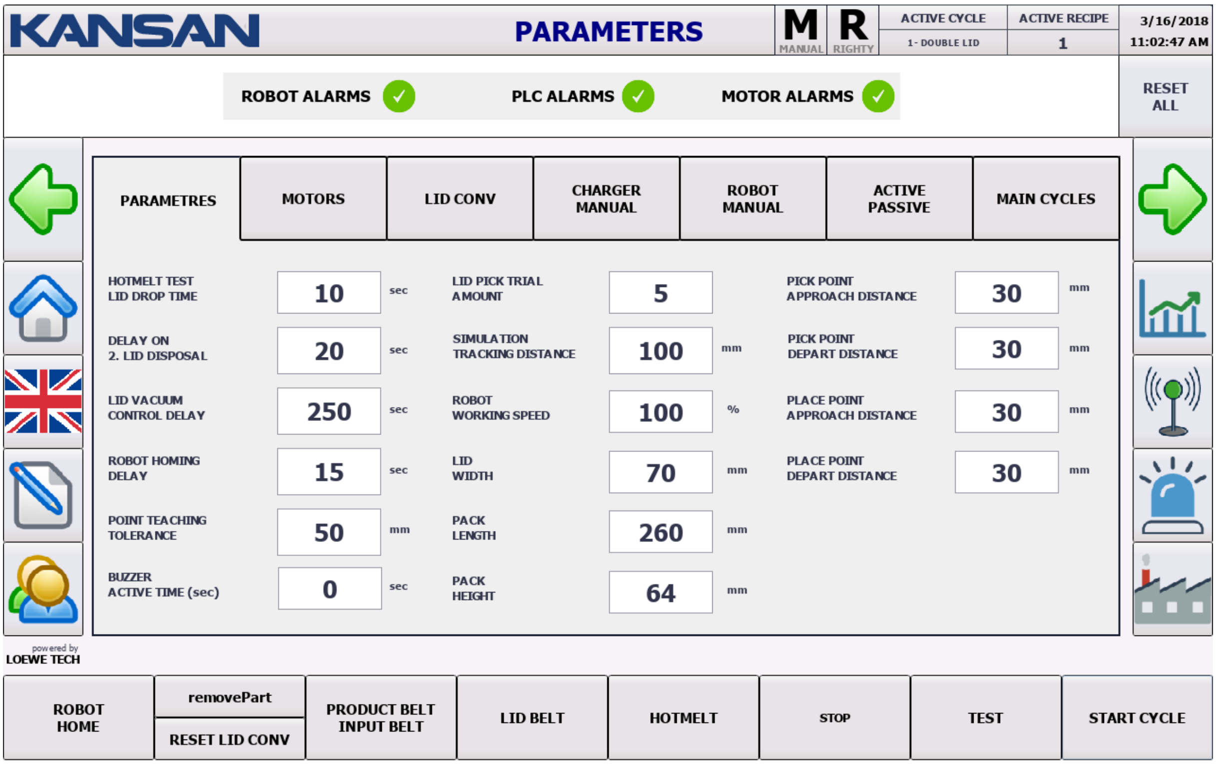
Instructions for the operator to display "SETTINGS" screen

✓ Press the symbol



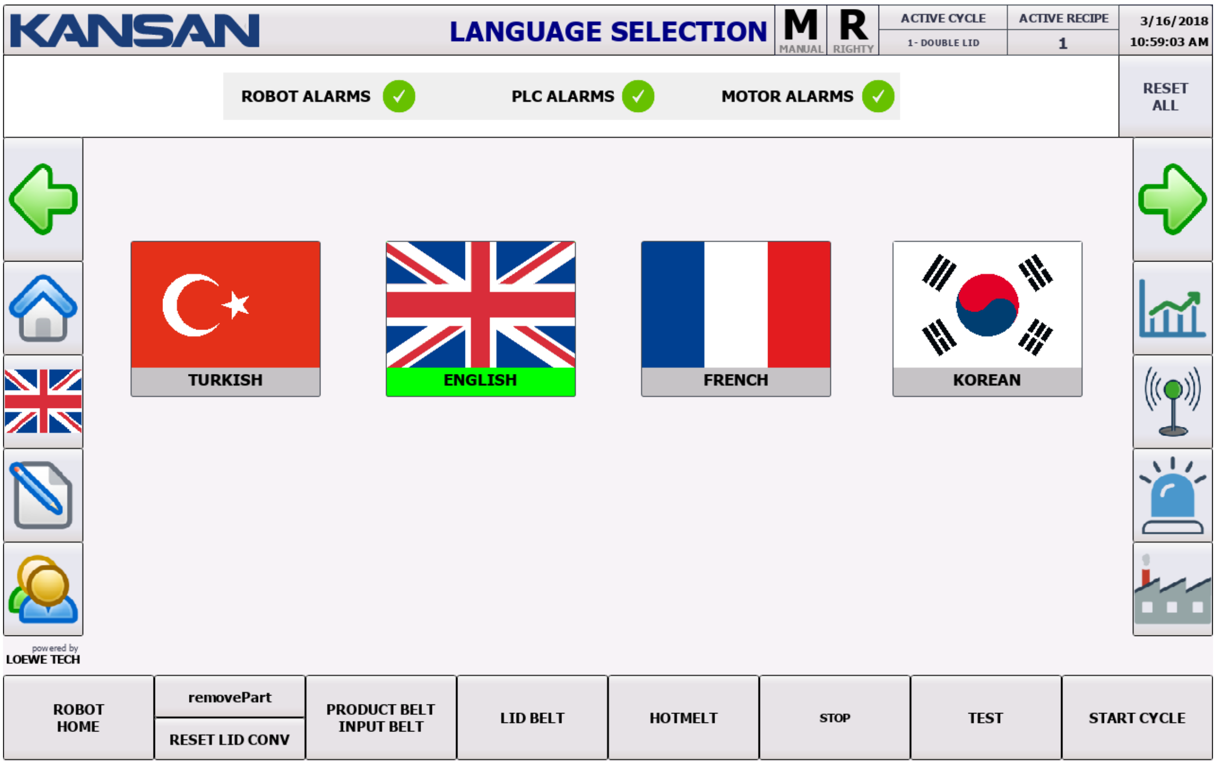
On left of screen.

Incoming Screen



The Current Display contains parameters and value settings for the machine.

LANGUAGE SELECTION



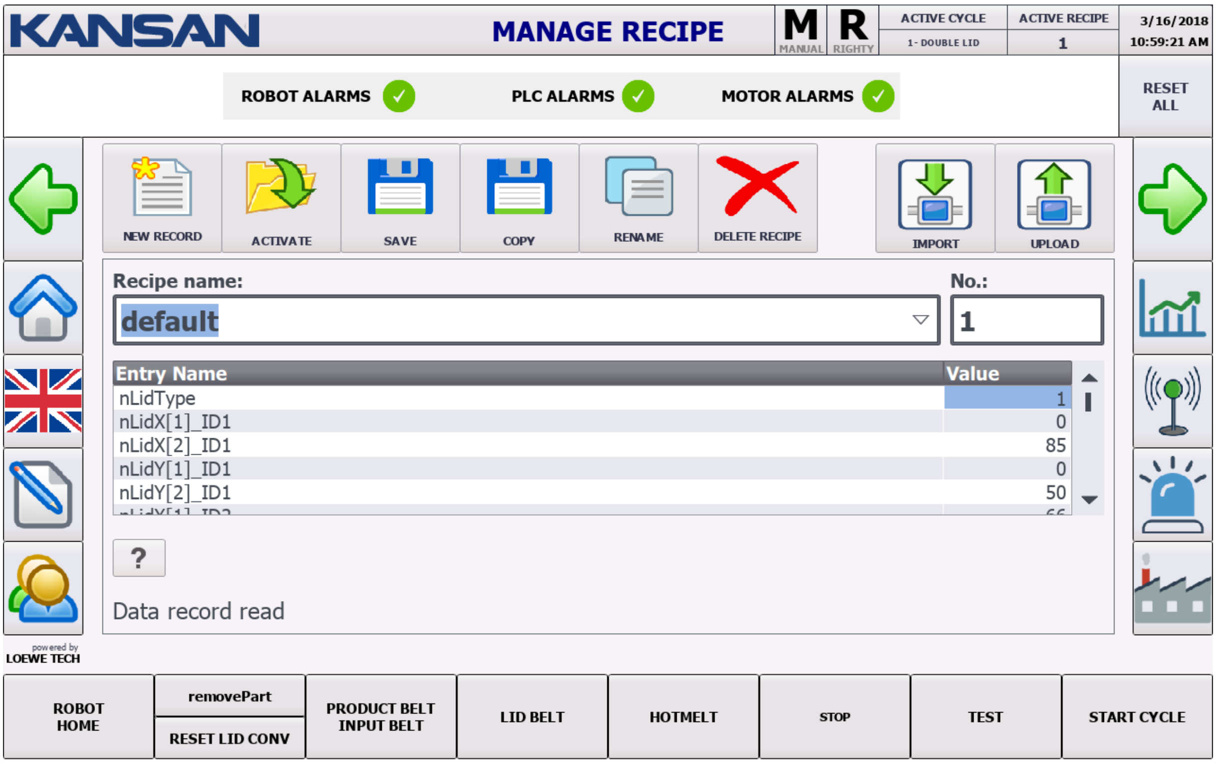
On the current page, Panel languages can be selected in Turkish, English, German, French and Russian languages.

MANAGE RECIPE

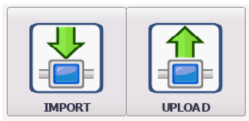
Instructions for the operator to display "MANAGE RECIPE" screen

✓ Press the symbol  on left of screen.

Incoming Screen



The current screen contains settings for recipe management.



In order to transfer the recipe to machine, IMPORT-UPLOAD features are used.

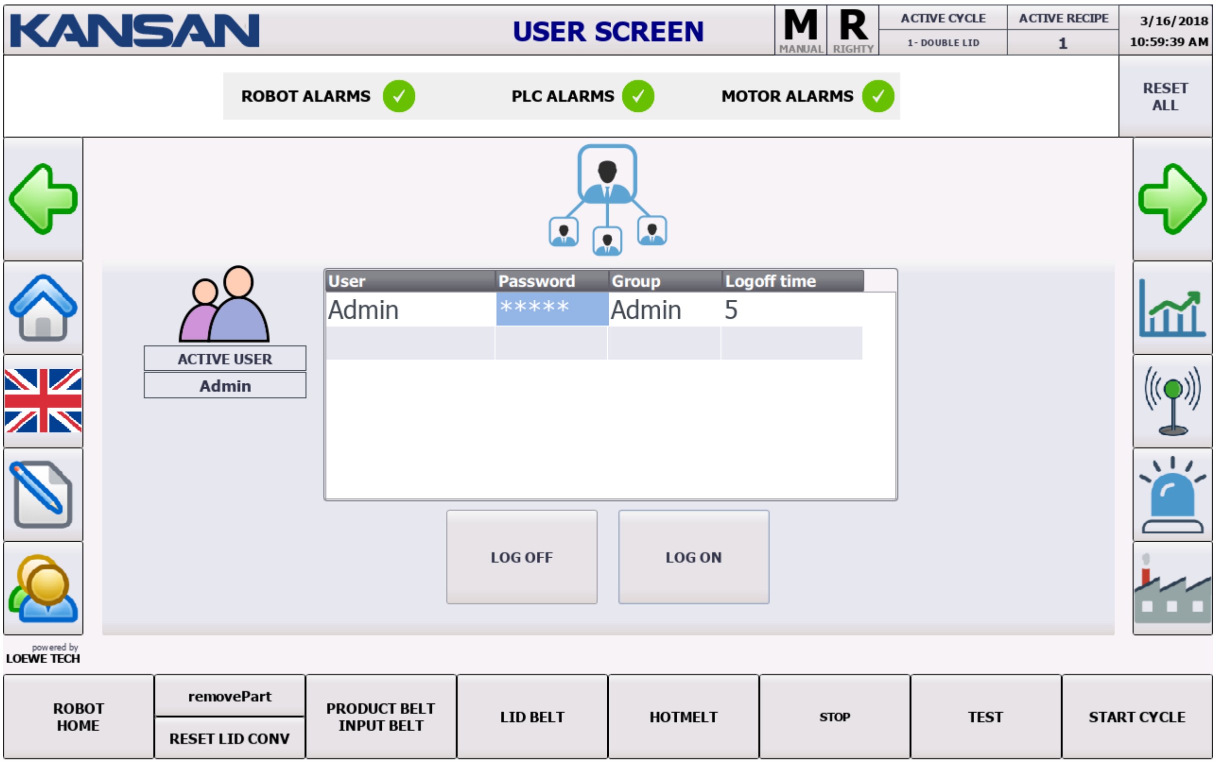
To do this, the user must be authorized.

USER SCREEN

Instructions for the oprerator to display “USER SCREEN” screen

✓ Press the symbol  on left of screen.

<u>Gelecek Olan Ekran</u>



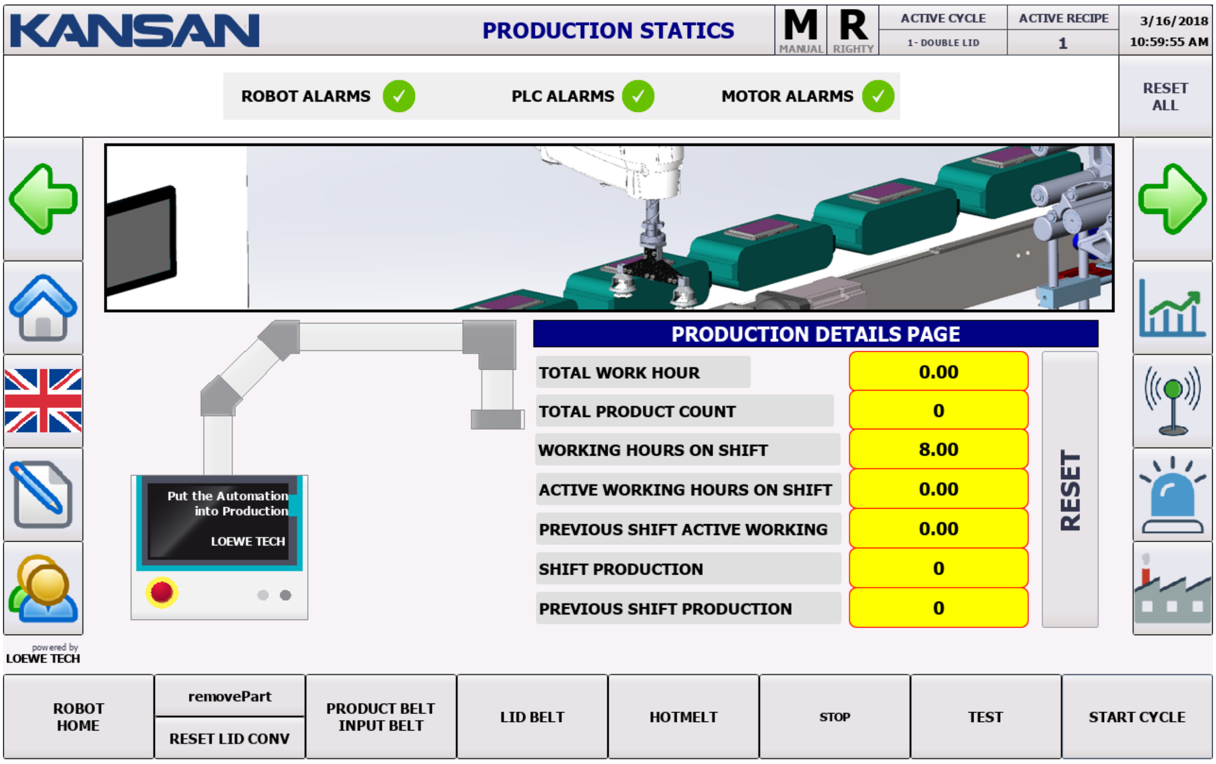
On the current page, user settings are made.

PRODUCTION STATICS

Instructions for the operator to display "PRODUCTION STATICS" screen

✓ Press the symbol  on left of screen.

Incoming Screen



On Production Statics Screen, You can display :

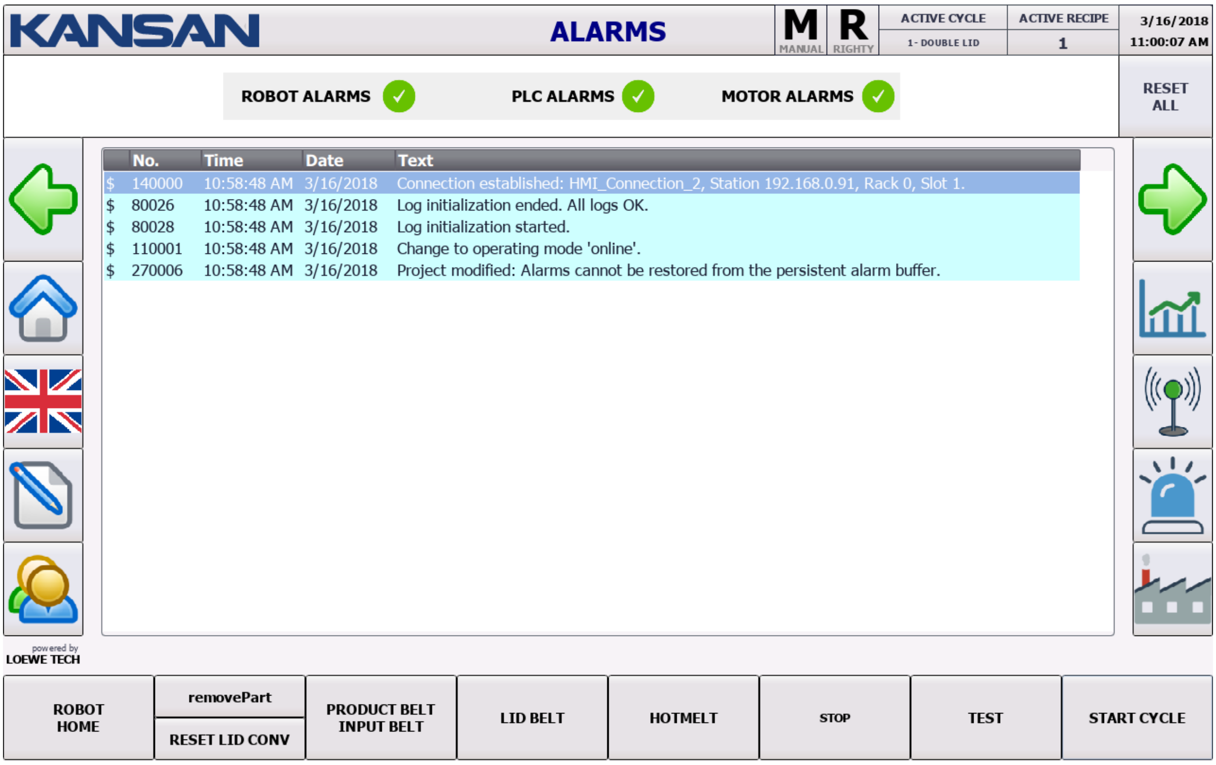
- ✓ Total Work Hour
- ✓ Total Production Count
- ✓ Working Hours on Shift
- ✓ Active Working Hours on Shift
- ✓ Previous Shift Active Working
- ✓ Shift Production
- ✓ Previous Shift Production.

ALARMS

Instructions for the operator to display "ALARMS" screen

✓ Press the symbol  on left of screen.

<u>Gelecek Olan Ekran</u>



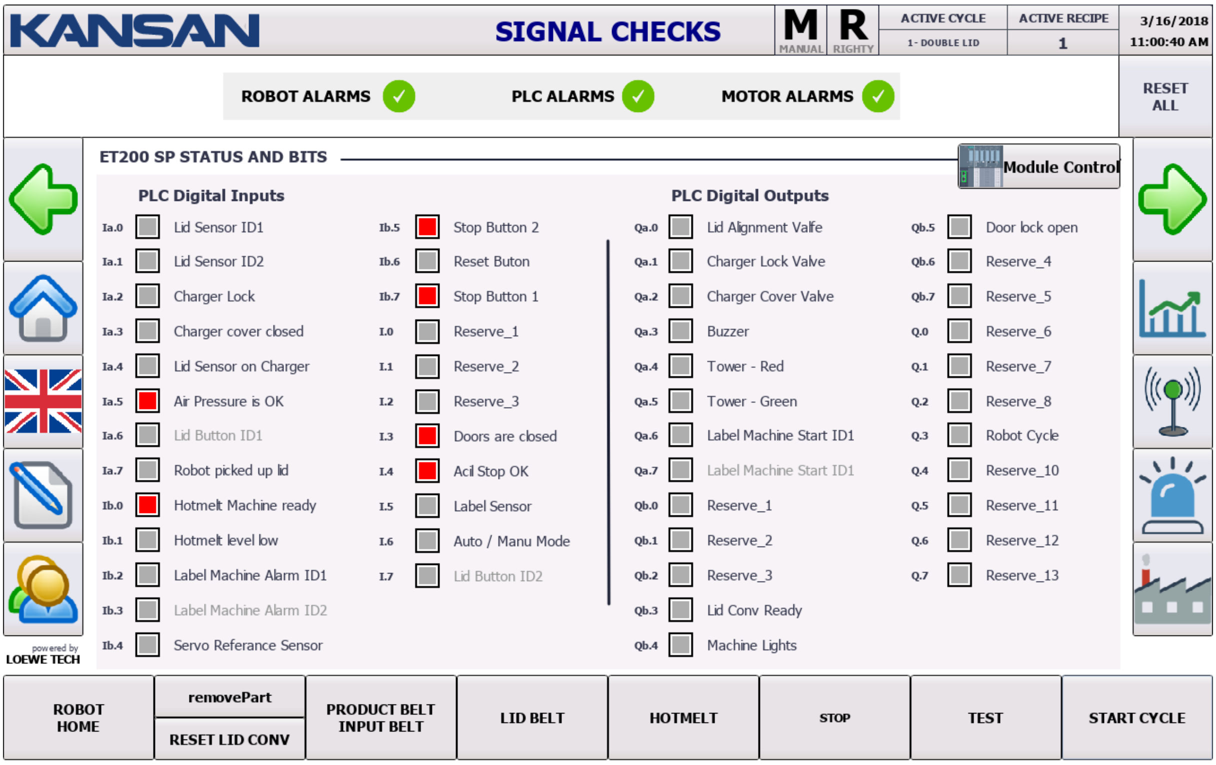
On Alarm Screen, current alarms are listed.

SIGNAL CHECKS

Instructions for the operator to display "SIGNAL CHECKS" screen

✓ Press the symbol  →  on left of screen.

<u>Incoming Screen</u>



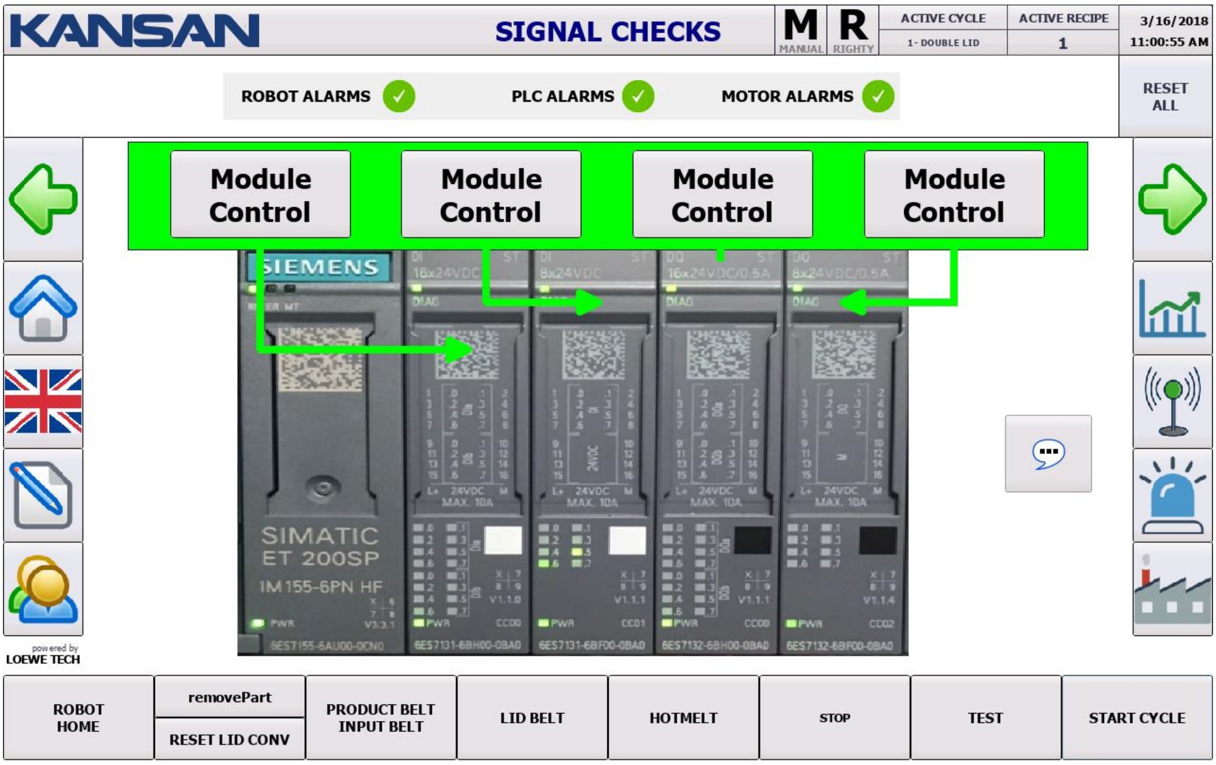
On this page, The signal checks are done.

MODULE CONTROL

Instructions for the operator to display “MODULE CONTROL” screen

✓ Press the symbol  on left of screen.

<u>Incoming Screen</u>



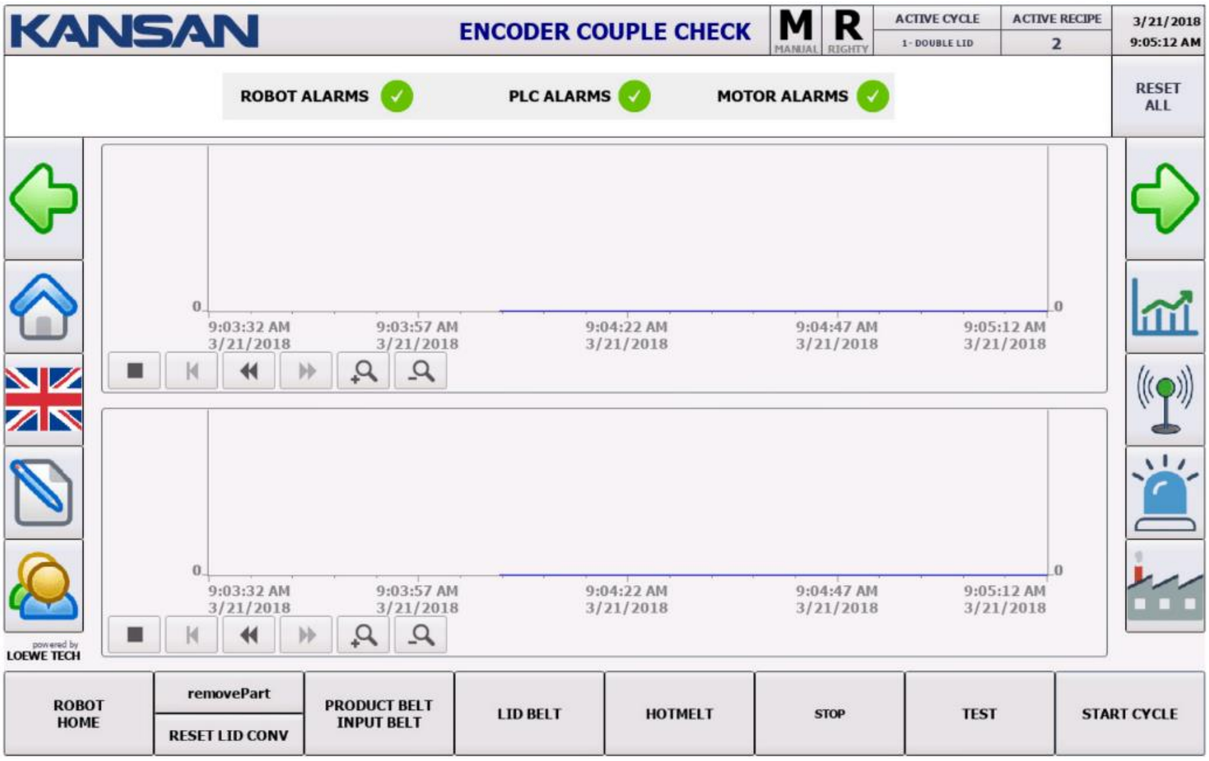
On this page, status of each module can be displayed.

ENCODER COUPLE CHECK

Instructions for the operator to display “ENCODER COUPLE CHECK” screen

✓ Press the symbol  on left of screen.

Incoming Screen

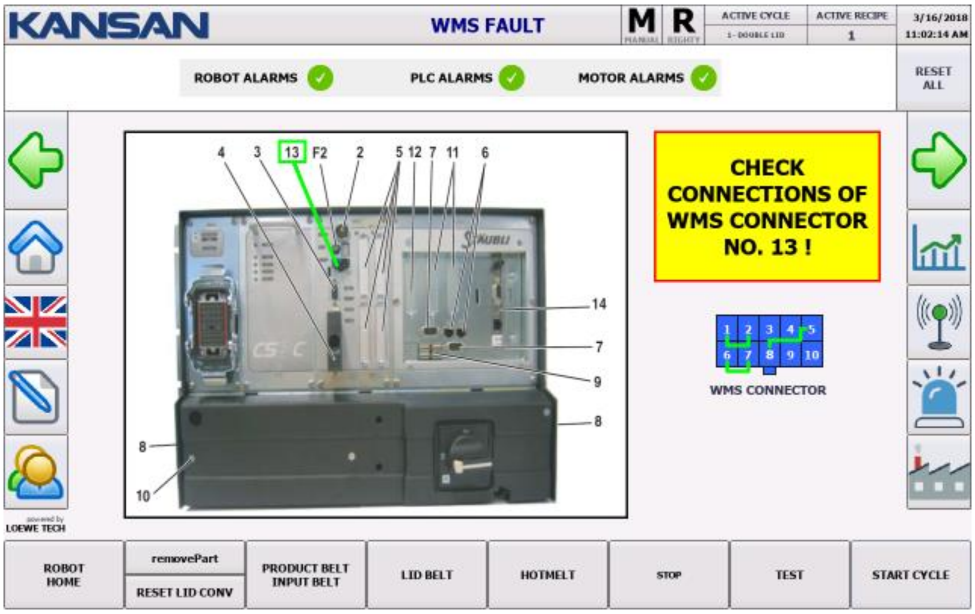


On this page, ENCODER COUPLE CHECK is done.

WARNINGS ON SCREEN AFTER FAULT

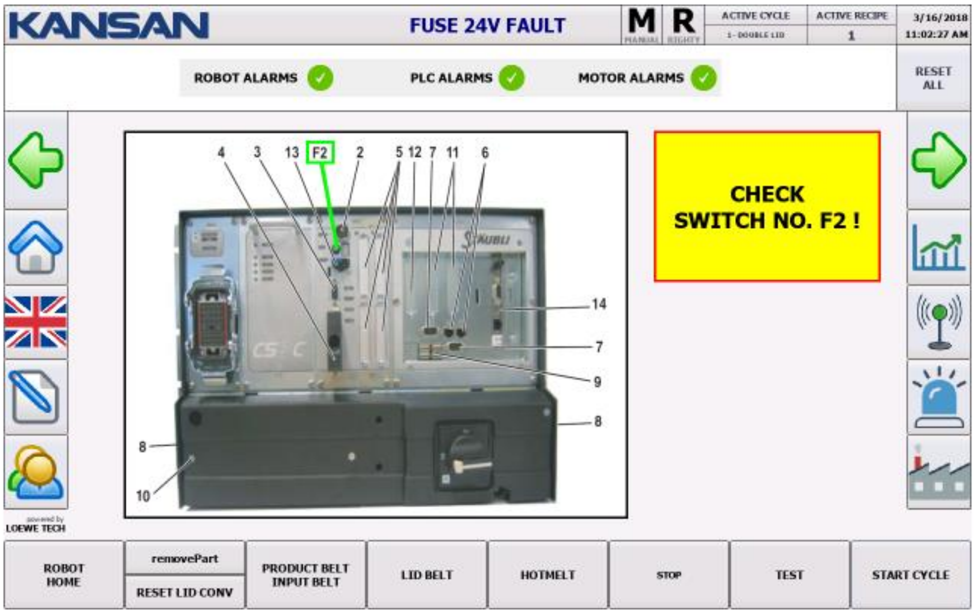
WMS FAULT

When WMS Connection error occurs, the following warning screen comes on screen automatically with its solution.



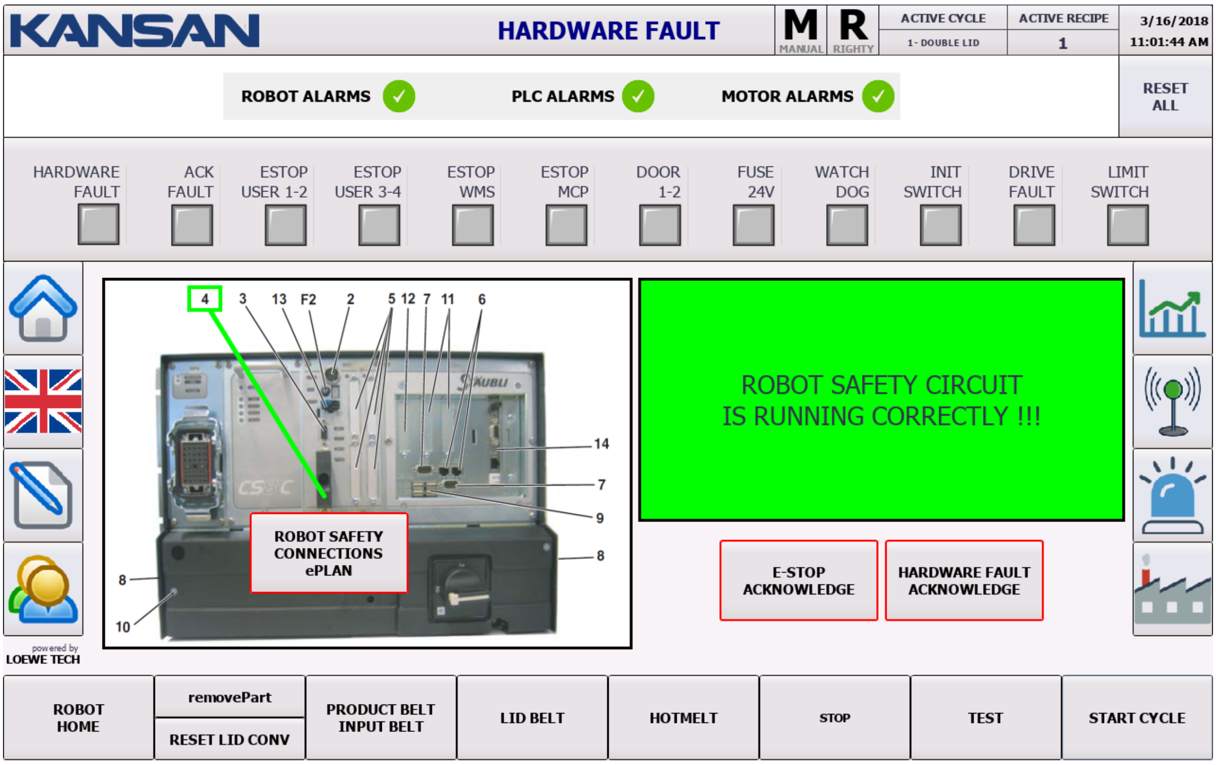
24V FUSE FAULT

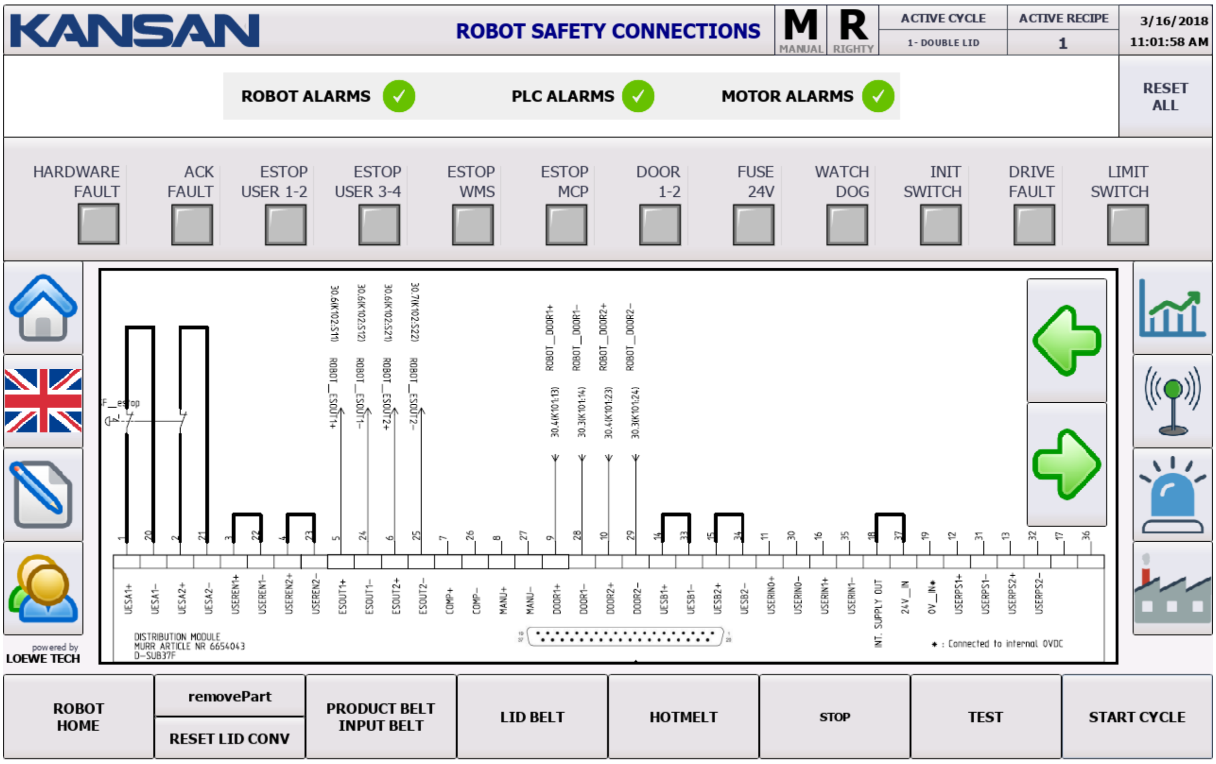
When FUSE 24V FAULT occurs, the following warning screen comes on screen automatically with its solution.



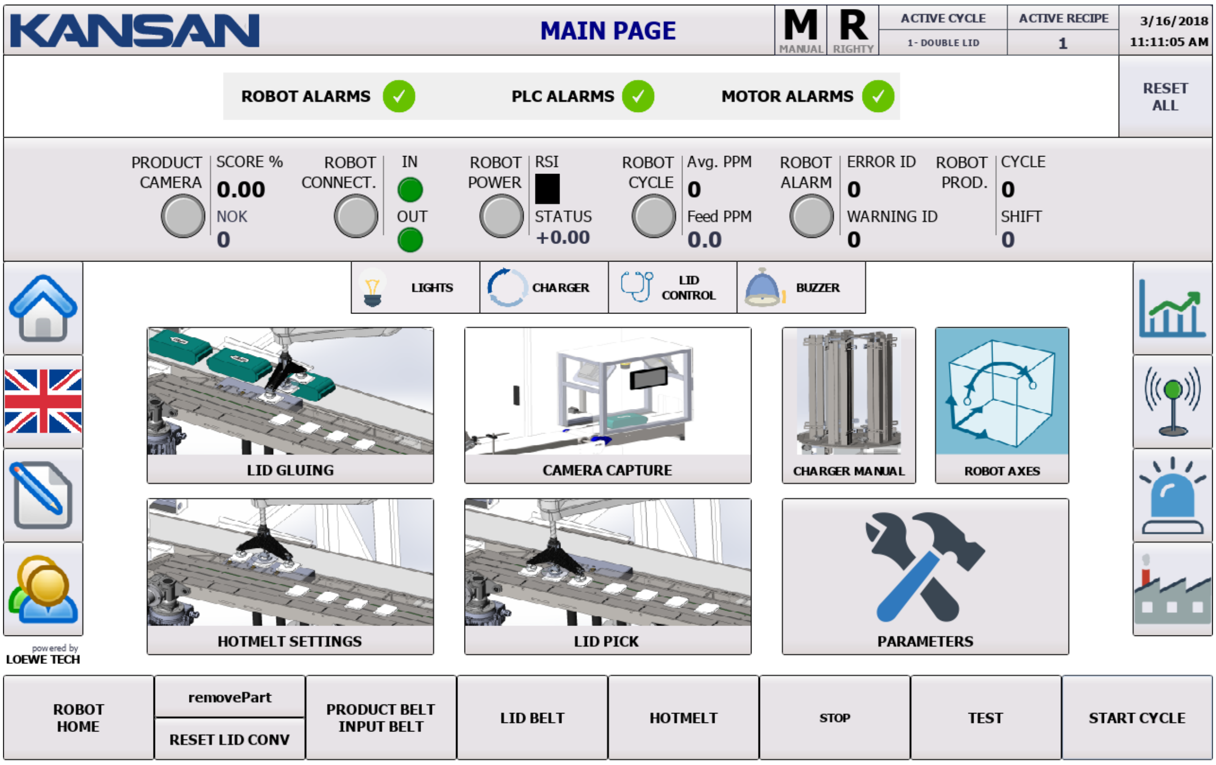
HARDWARE FAULT CHECK

On this page, HARDWARE FAULT CHECK is done.





MAIN SCREEN



a) UPPER SECTION

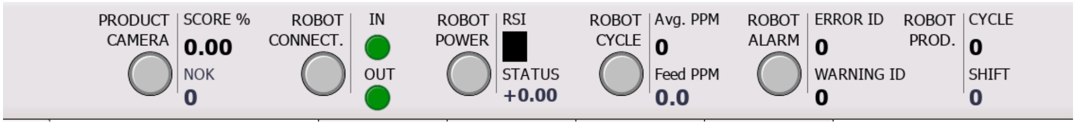
SYMBOL PANEL	ANLAMI
	Indicates Machine Mode. There are 2 modes. Automatic Manual
	Indicates Robotic Arm direction. There are 2 types. Righty- Right Direction
	Indicates Active Cycle and Recipe Type.

b) ALARM DISPLAYING SECTION

Alarm display section; Displays status of alarms for Robot, PLC and Motor.

With the option, the machine errors are reset.

c) SITUATION SECTION



SYMBOL ON PANEL	EXPLANATION
	Display Product Camera on machine.
	“For verified" products, it shows the percentage of similarity of the taught model.
	Displays the number of unverified products.
	It shows the communication status between Robot and PLC.
	It shows the status of communication bits between Robot and PLC.
	It shows the Robot arm strength status.

	It shows the character on segment display which is on Robotic Controls and counter code of ASCII(American Standard Code for Information Interchange) Code.
	It shows the status of Robot Cycles.
	**Avg. PPM:** The actual amount of packets generated per minute based on the robot cycle time. **Feed PPM:** Displays the number of products feeded per minute based on the product sensor.
	It shows the Robot Alarm status.
	It shows the Robot Error and Warning ID.
	**Cycle:** It shows the number of lids which Robot applicated during the cycle. **Shift: :** It shows the number of lids which Robot applicated during the shift.

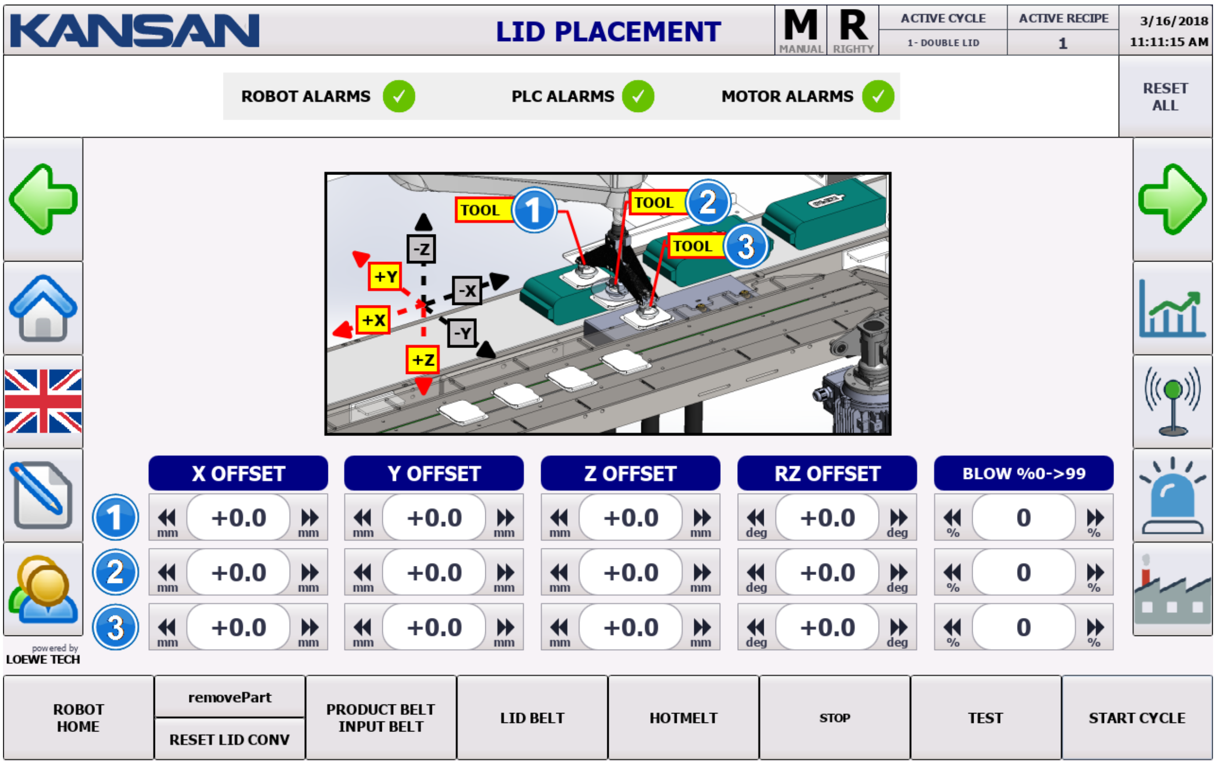
LID PLACEMENT SETTINGS

Instructions for the operator to display "LID PLACEMENT SETTINGS" screen

- ✓ Press the symbol  → 

on left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON LID PLACEMENT SETTINGS

- ✓ **X Axis Offset Setting**
- ✓ **Y Axis Offset Setting**
- ✓ **Z Axis Offset Setting**
- ✓ **Rz Offset Setting**
- ✓ **Blow**

X Axis Offset Setting: This is where the offset settings on the X axis of the lid are made.

Y Axis Offset Setting: This is where the offset settings on the Y axis of the lid are made.

Z Axis Offset Setting: This is where the offset settings on the Z axis of the lid are made.

Rz Offset Setting: This is where the offset-angle settings on the Z axis of the lid are made.

Blow: The robot enables the blower to be active on any percentage of the distance when it is approaching vertically to package to applicate lid.

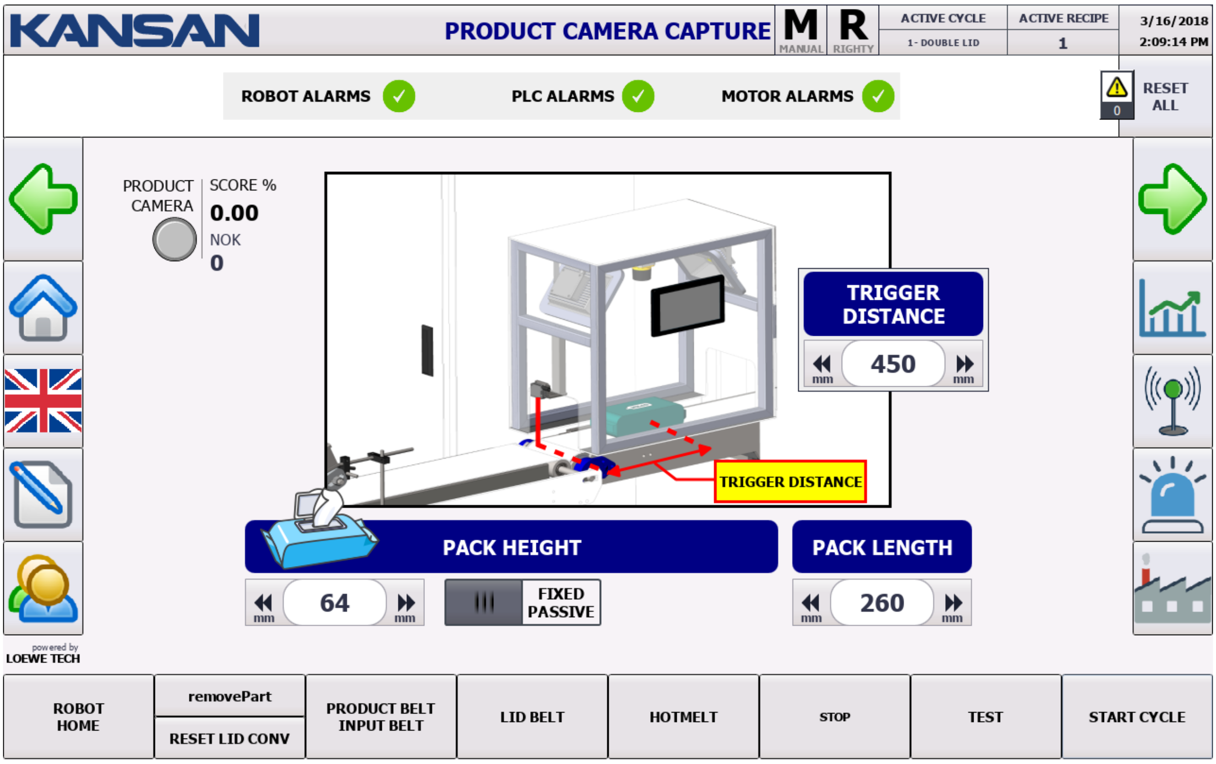
PRODUCT CAMERA CAPTURE SETTIGS

Intructions for the operator to display "PRODUCT CAMERA CAPTURE SETTINGS" screen

- ✓ Press the symbol  → 

on left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON PRODUCT CAMERA CAPTURE SETTINGS

- ✓ **Package Height Setting**
- ✓ **Package Height Fixed Passive**
- ✓ **Package Length Setting**
- ✓ **Trigger Distance Setting**

Package Height Setting: It is the setting that the package height is defined.

Package Height Fixed Passive: Automatic adjustment of the standard package height 64 mm - On / Off.

Machine on Active status: 64 mm, Passive Status: The value entered to panel is based.

Package Length Setting: It is the setting that the package length is defined.

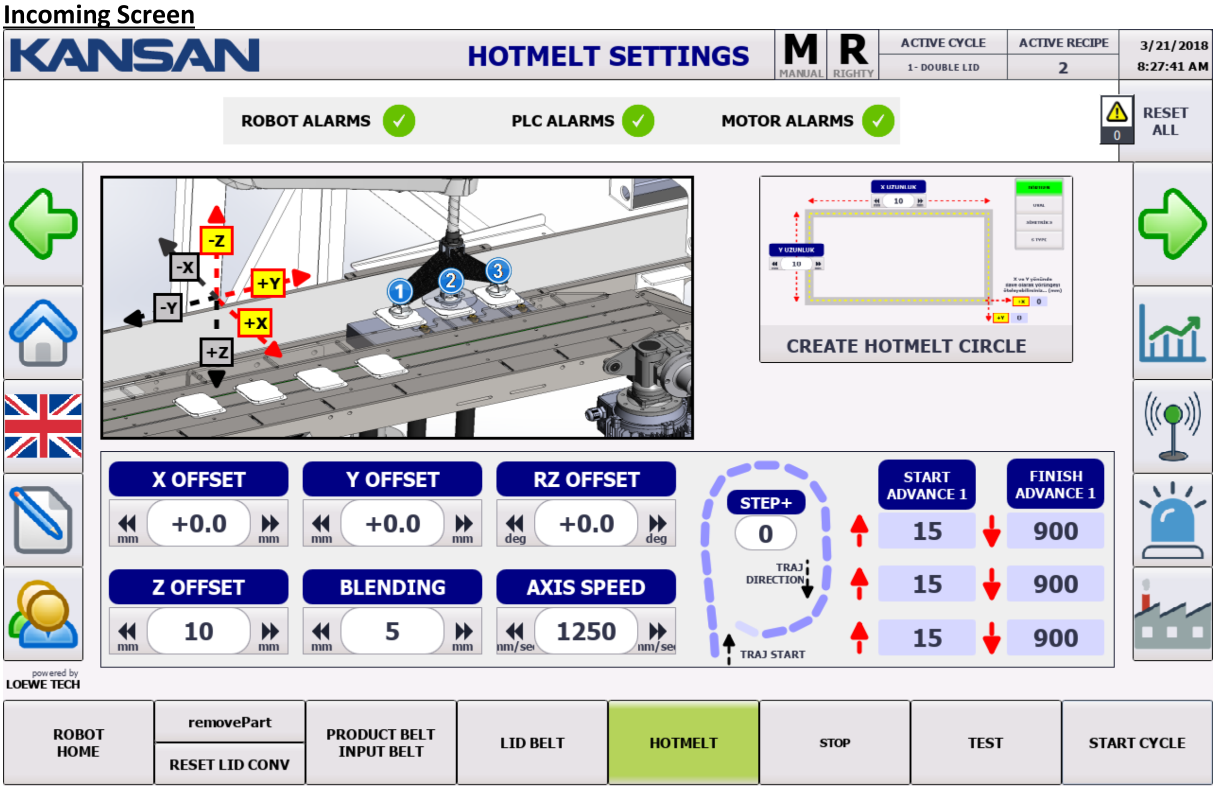
Trigger Distance Setting: It refers to the distance between the first time package seen by sensor and trigger time.

HOTMELT SETTINGS

Instructions for the operator to display "HOTMELT SETTINGS" screen

✓ Press the symbol  → 
on left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON HOTMELT SETTINGS

- ✓ **Hotmelt Circle Setting**
- ✓ **RealTime Open/Close**
- ✓ **Hotmelt Circle Line Linear Active/Passive**
- ✓ **X Axis Offset Setting**
- ✓ **Y Axis Offset Setting**
- ✓ **Z Axis Offset Setting**
- ✓ **Rz Offset Setting**
- ✓ **Blending Setting**
- ✓ **Circle Speed Setting**
- ✓ **Start Advance 1**
- ✓ **Finish Advance 1**
- ✓ **Start Advance 2**
- ✓ **Finish Advance 2**

Hotmelt Circle Setting: It is the setting that makes Circle.

RealTime Open/Close: If RealTime is in the Active state, it calculates the circle according to the parameters; If it is off, it does not calculate.

Hotmelt Circle Line Linear Active/Passive: Expresses the movement mode of the cycle.

X Axis Offset Setting: This is where the offset settings on the X axis of the lid are made.

Y Axis Offset Setting: This is where the offset settings on the Y axis of the lid are made.

Z Axis Offset Setting: This is where the offset settings on the Z axis of the lid are made.

Rz Offset Setting: This is where the offset-angle settings on the Rz axis of the lid are made.

Blending Setting: It is the softening setting between crossing points.

Circle Speed Setting: The circle speed is set here.

Start Advance 1: 1. The value of Start Advance belongs to hotmelt. As it increases, it delays the moment hotmelt to begin cycle; As it begins to decrease, it takes the moment hotmelt to begin cycle.

Finish Advance 1: The value of Finish Advance belongs to hotmelt. As it increases, it delays the moment hotmelt to finish cycle; As it begins to decrease, it takes the moment hotmelt to finish cycle.

Start Advance 2: 2. The value of Start Advance belongs to hotmelt. As it increases, it delays the moment hotmelt to begin cycle; As it begins to decrease, it takes the moment hotmelt to begin cycle.

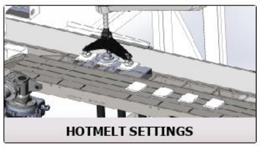
Finish Advance 2: 2 The value of Finish Advance belongs to hotmelt. As it increases, it delays the moment hotmelt to finish cycle; As it begins to decrease, it takes the moment hotmelt to finish cycle.

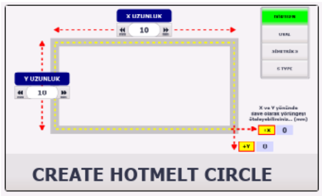
HOTMELT CIRCLE SETTINGS

SQUARE LID

Instructions for the operator to display "HOTMELT CIRCLE SETTINGS" screen

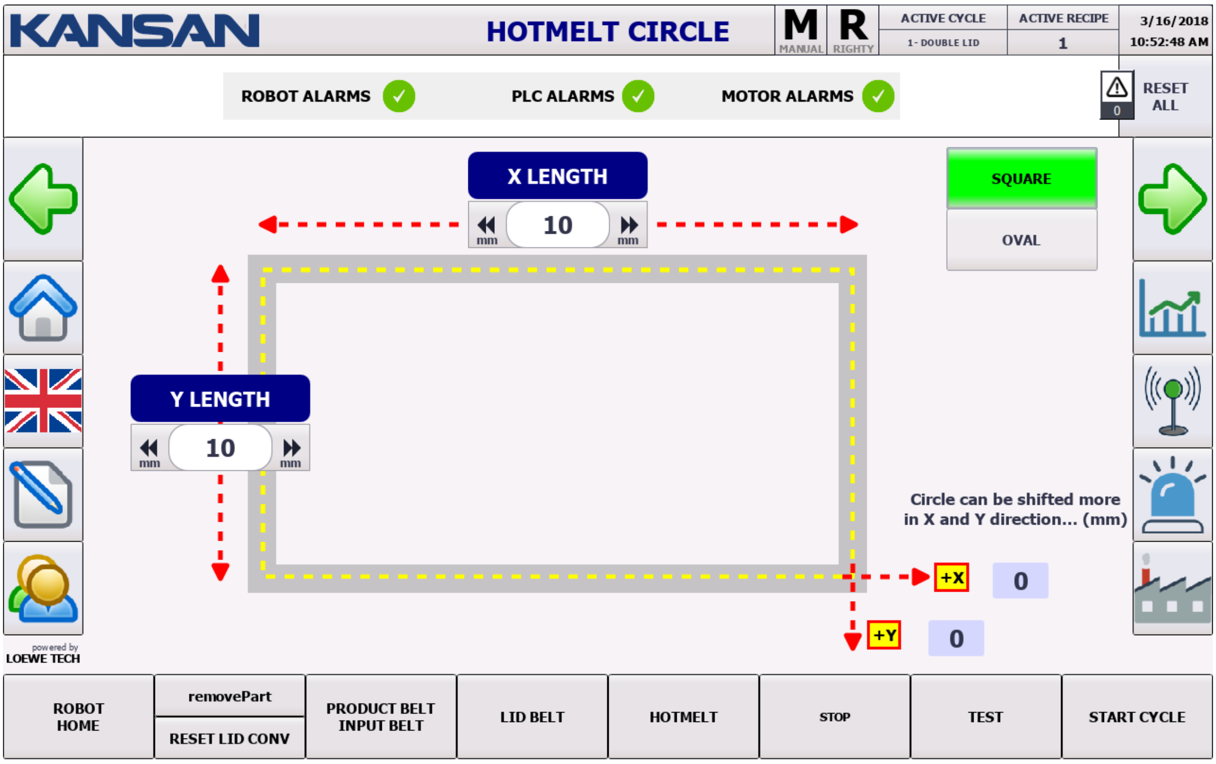
✓ Press the symbol 





On left of screen.

Incoming Screen



If the cover geometry is rectangular, settings are made here.

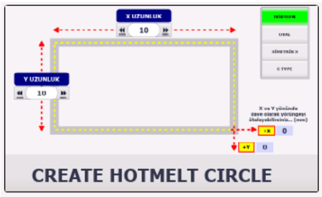
The length of the lid X and Y should be entered in this section.

HOTMELT CIRCLE SETTINGS

OVAL LID

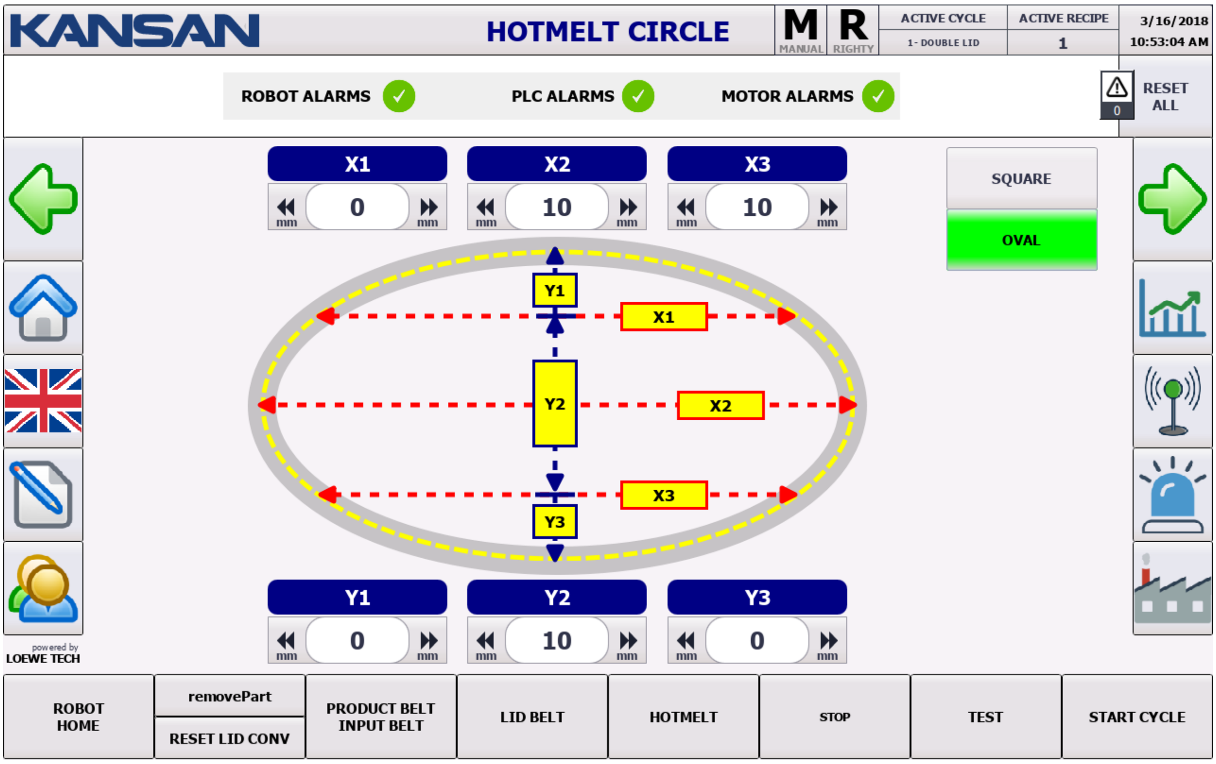
Instructions for the operator to display “HOTMELT CIRCLE SETTINGS” screen

✓ Press the symbol  



On left of screen.

Incoming Screen



If the Cover Geometry is Oval, settings are made here.

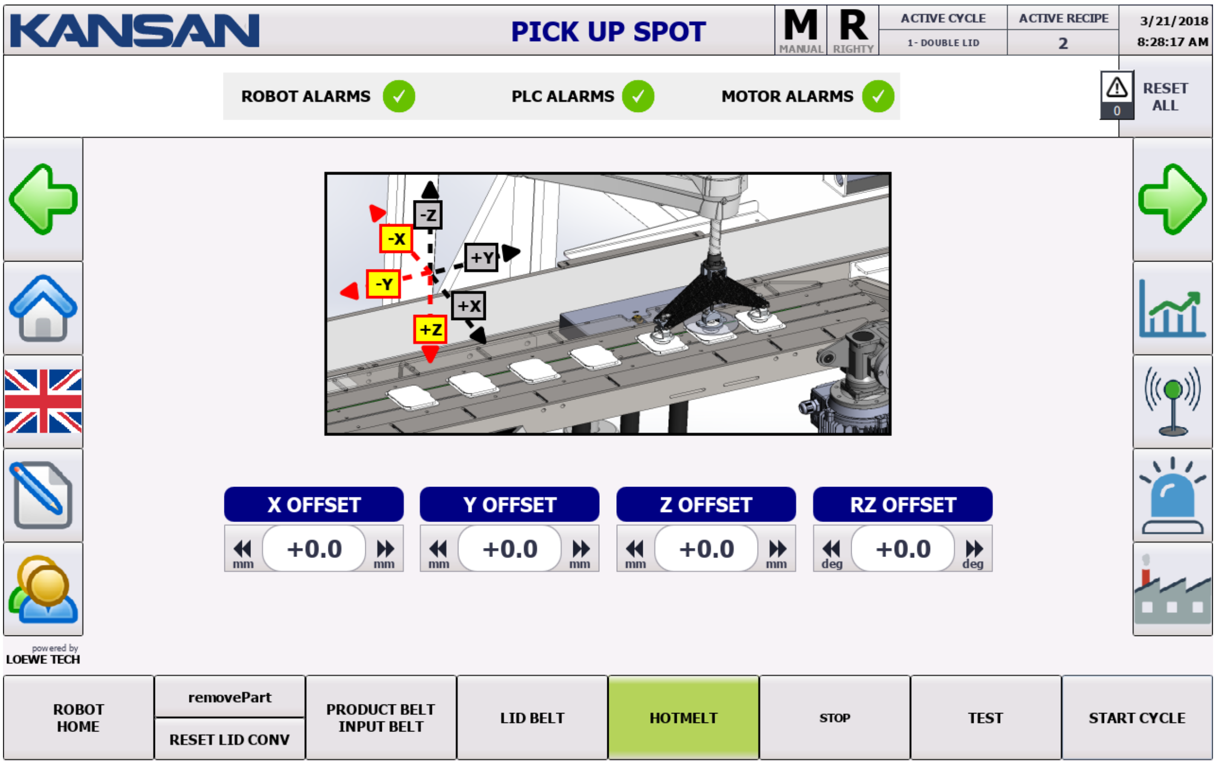
The values of the points forming the lid must be entered in this section.

LID PICK POINT SETTINGS

Instructions for the operator to display “LID PICK POINT SETTINGS” screen

✓ Press the symbol  → 
on left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON HOTMELT SETTINGS

- ✓ **X Axis Offset Settimg**
- ✓ **Y Axis Offset Setting**
- ✓ **Z Axis Offset Setting**
- ✓ **Rz Offset Setting**

X Axis Offset Setting: The offset settings on the robot X axis are made here.

Y Axis Offset Setting: The offset settings on the robot Y axis are made here.

Z Axis Offset Setting: The offset settings on the robot Z axis are made here.

Rz Offset Setting: The offset-angle settings on the robot Rz axis are made here.

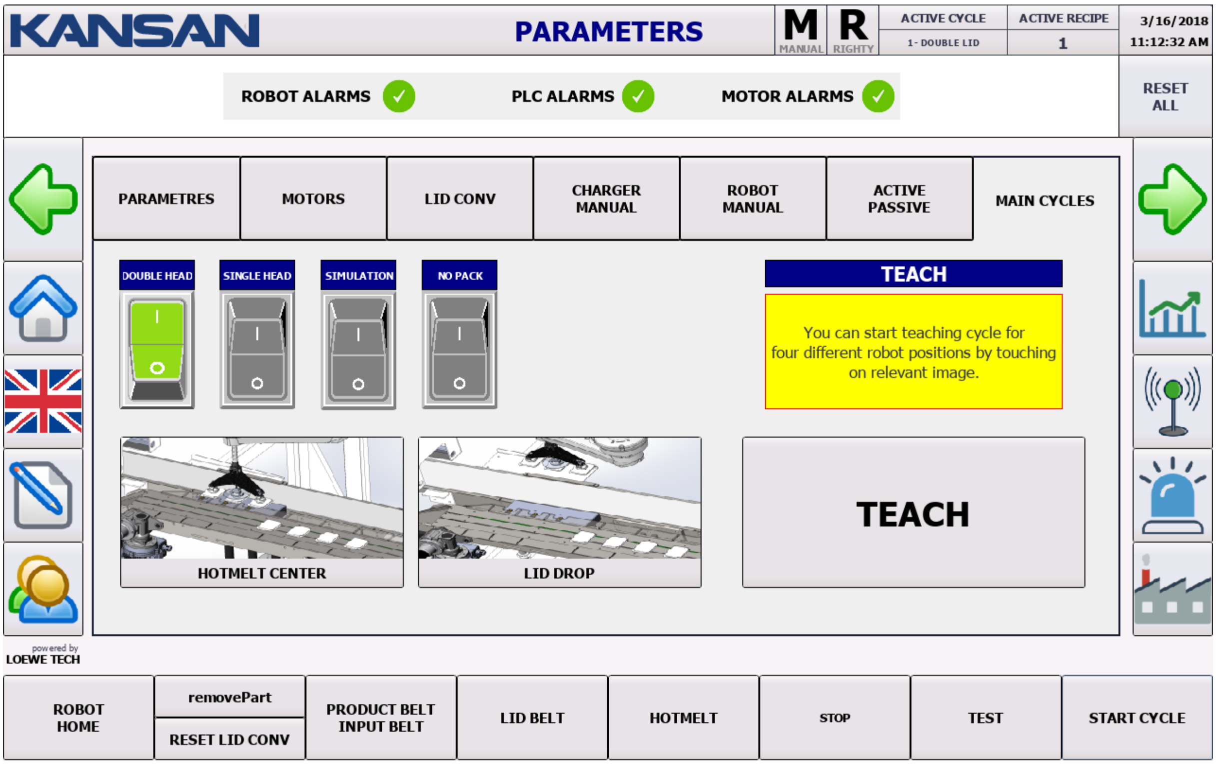
CIRCLES

Instructions for the operator to display "CIRCLE SETTINGS" on screen

- ✓ Press the symbol  → 

→ 
on left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON MAIN CIRCLES SCREEN

It includes Main Cycles of the machine. On this page the main cycles of the machine can be activated / deactivated.

- ✓ **Three-Headed Work On/Off**
- ✓ **SimPack On/Off**
- ✓ **SimPlace On/Off**
- ✓ **No pack work On/Off**

Three-headed work On/Off: It provides to robot three-way lid operation.

SimPack On/Off: It simulates the pick lid point.

SimPlace On/Off: It simulates the dropping lid point.

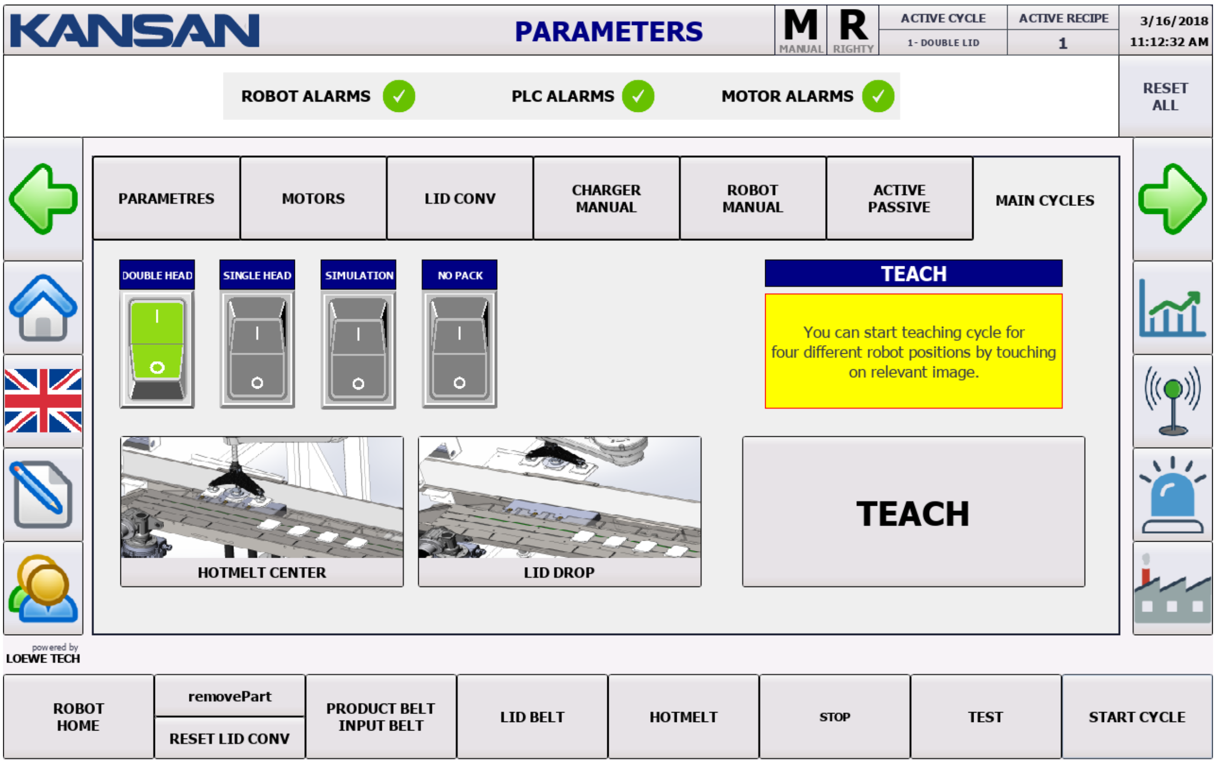
No pack work On/Off: Makinenin Paketsiz çalışmasına izin verir.

TEACHING POINT

Instructions for the operator to display "TEACHING POINT SETTINGS" screen

✓ Press the symbol 
On left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON TEACHING POINT SCREEN

- ✓ **Hotmelt Center Teaching Setting**
- ✓ **Lid Drop Teach Setting (Authorized user can make.)**

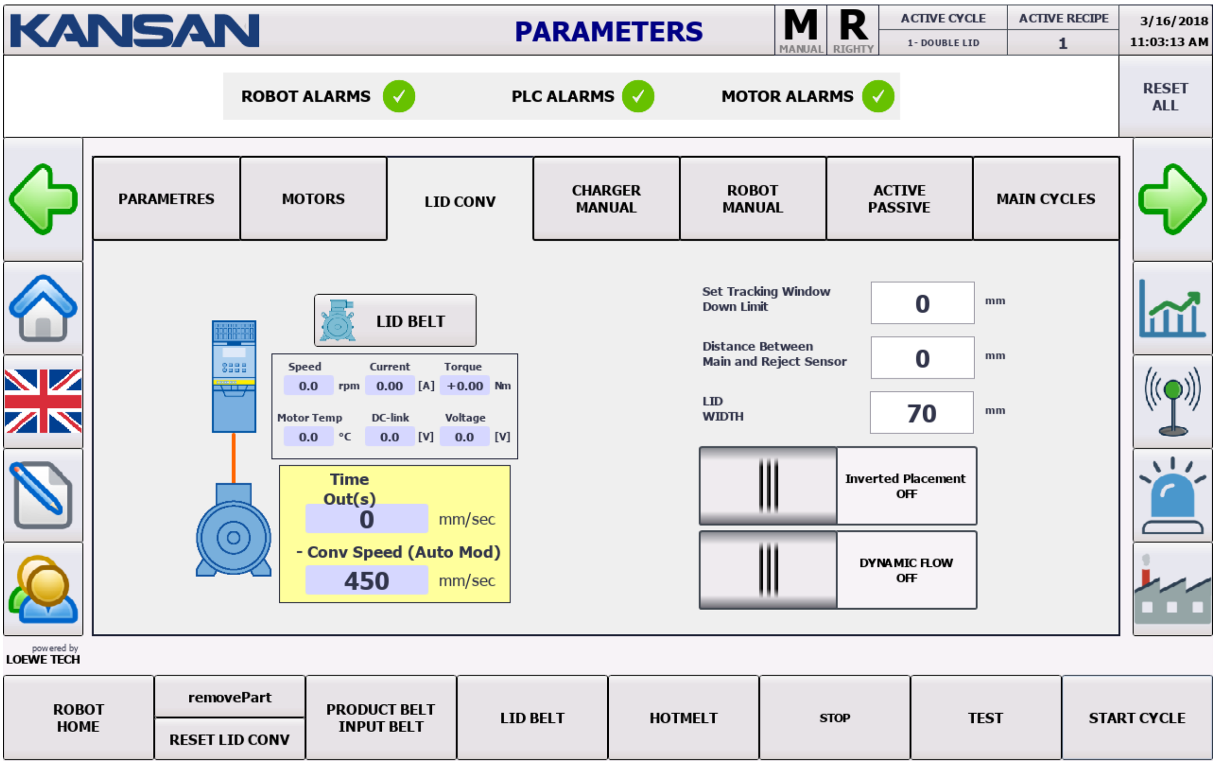
TEACHING BUTTON MUST ABSOLUTELY PRESSED WHEN PROTECTION DOOR IN CLOSED POSITION!

LID CONVEYOR

Instructions for the operator to display “LID CONVEYOR” page

- ✓ Press the symbol  on left of screen.

Incoming Screen



SETTINGS THAT OPERATOR CAN MAKE ON LID SERVO PAGE

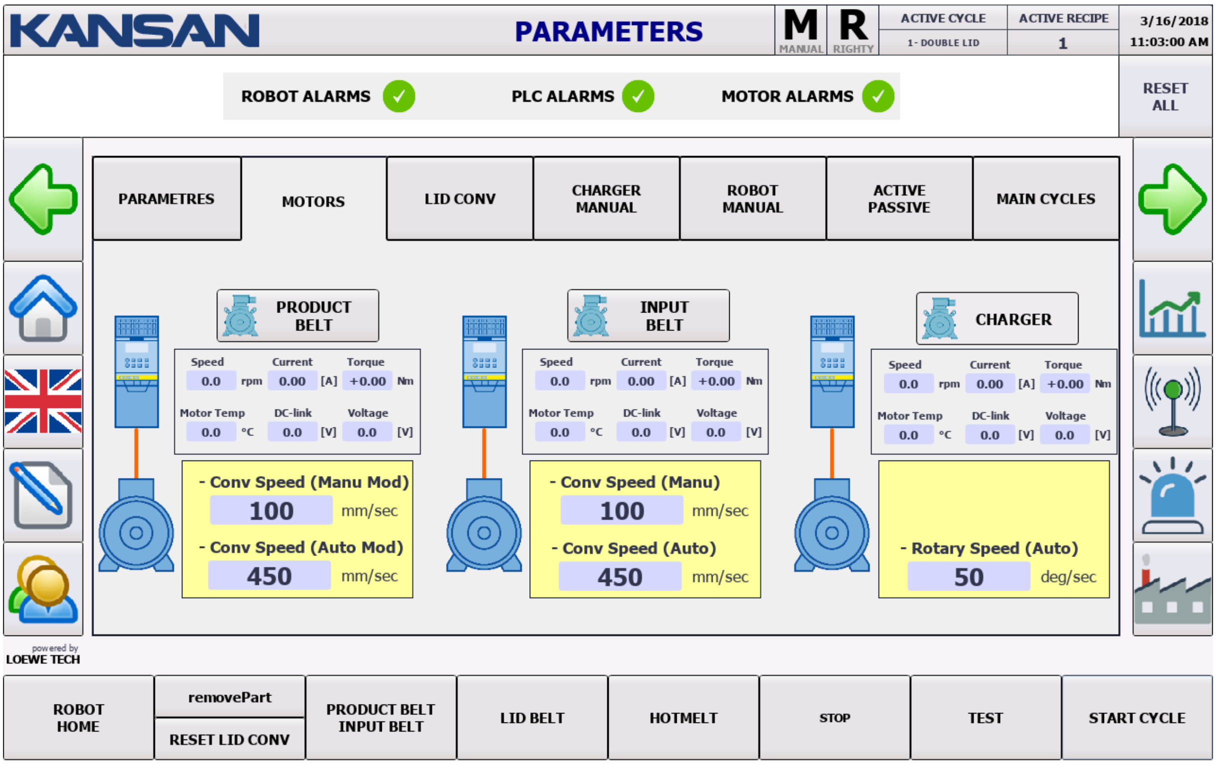
- ✓ **Set Tracking Window Down Limit:** If necessary, conveyor changes Soldier Position to Positive (+) and Negative (-)
- ✓ **Distance Between Main and Reject Sensor:** It is the section where the distance value between Input and Output Sensors is entered.
- ✓ **Lid Width:** The section where the width value of the lid is entered.
- ✓ **İnverted Placement:** The setting which the lid location of Horizontal-Vertical position, can be adjusted to On / Off.
- ✓ **Dynamic Flow:** It is the setting which the speed of the lid conveyor and the conveyor of the product can be synchronized to On / Off.

MOTORS

Instructions for the operator to display “MOTORS” screen

✓ Press the symbol  on left of screen.

Incoming Screen



The screen displaying the status of the motors on the machine

Motors

-Speed (Manual and Automatic Mode)

-Flow

-Tork

-Heat

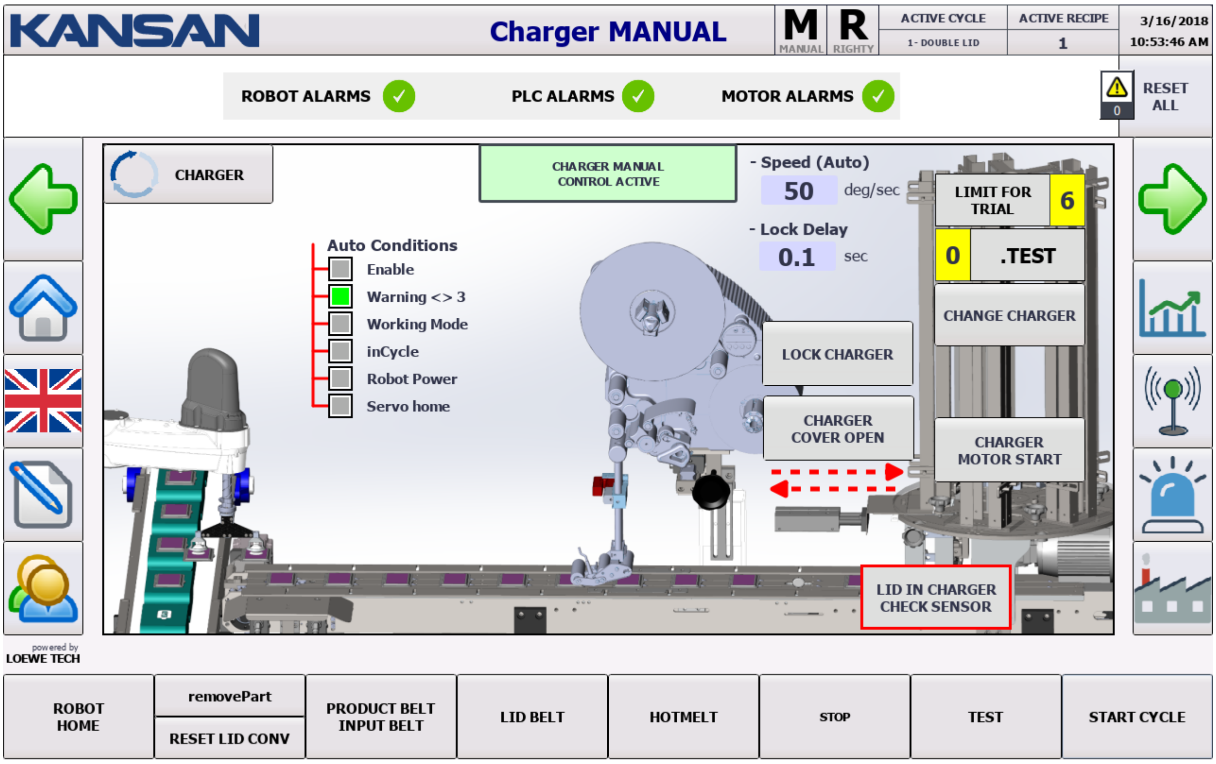
-Voltage values are displayed.

CHARGER MANUAL

Instructions for the operator to display "CHARGER MANUAL" screen

✓ Press the symbol  →  on left of screen.

Incoming Screen



On this screen the status of the Charger can be checked. When the key on panel is in the Manual / Automatic position, the Operator can use 4 combinations on this page.

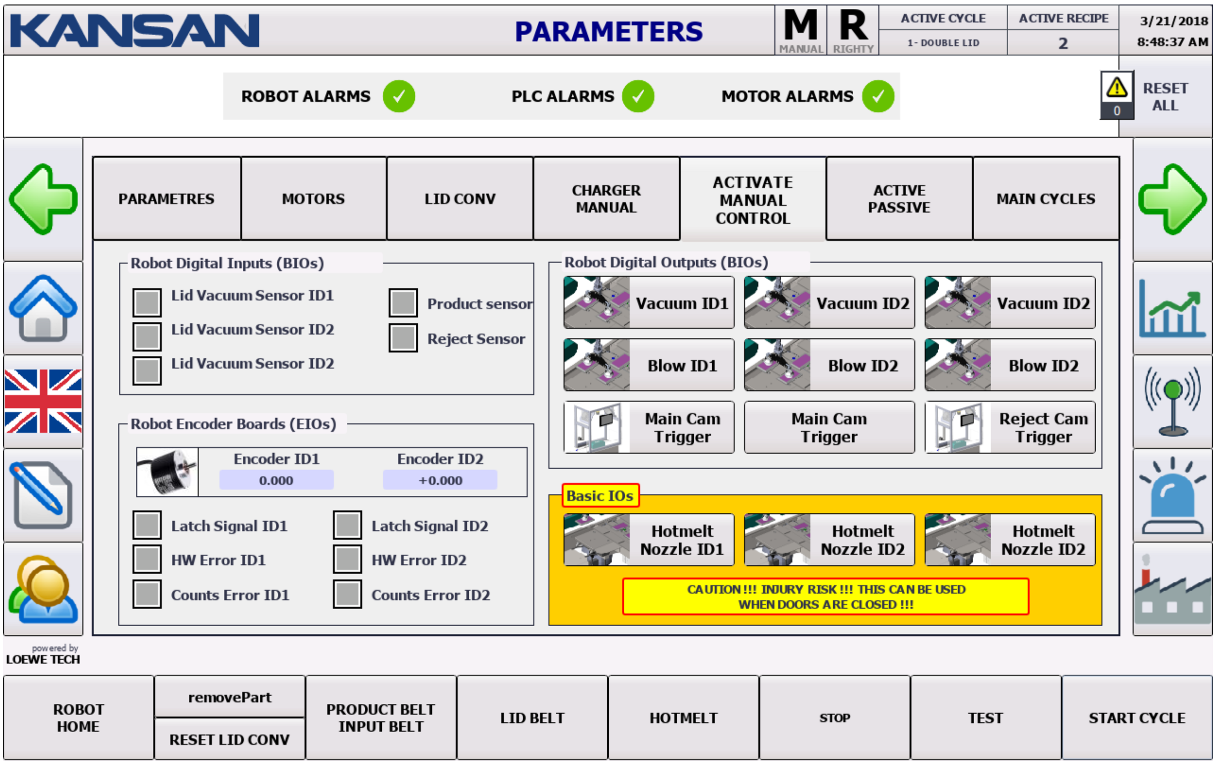
5. Machine on Manual + Charger Passive = CONTROL ACTIVE
6. Machine on Manual + Charger Active = CYCLE ACTIVE
7. Machine on Automatic + Charger Active = TOTALLY PASSIVE
8. Machine on Automatic + Charger Passive = TOTALLY PASSIVE

ACTIVATE MANUAL CONTROL

Instructions for the operator to display "ACTIVATE MANUAL CONTROL" page

✓ Press the symbol 
On left of screen.

Incoming Screen



Robot 1 and 2 Head Vacuum and Blow settings; Main Cam and Reject Cam settings are made here.

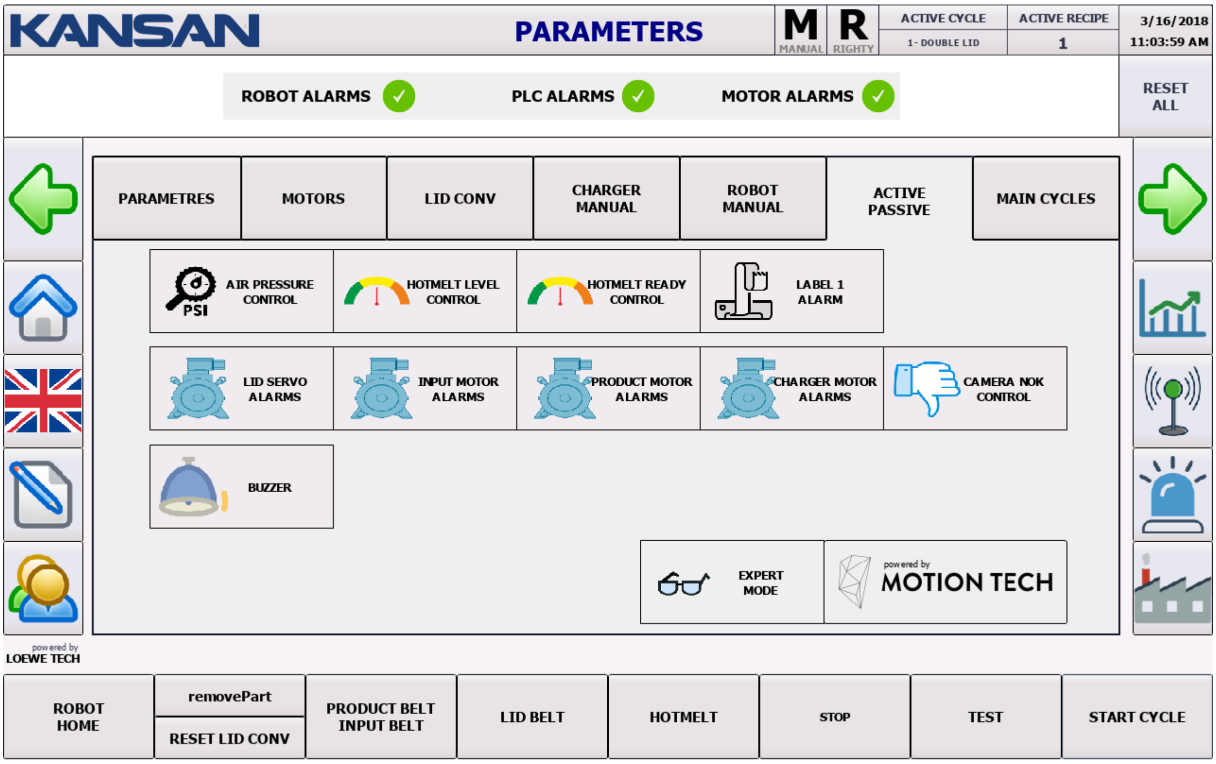
The Protection Doors must be in the off position while performing these settings.

ACTIVE / PASSIVE

Instructions for the operator to display "ACTIVE/PASSIVE" screen

✓ Press the symbol → ACTIVE PASSIVE on left of screen.

Incoming Screen



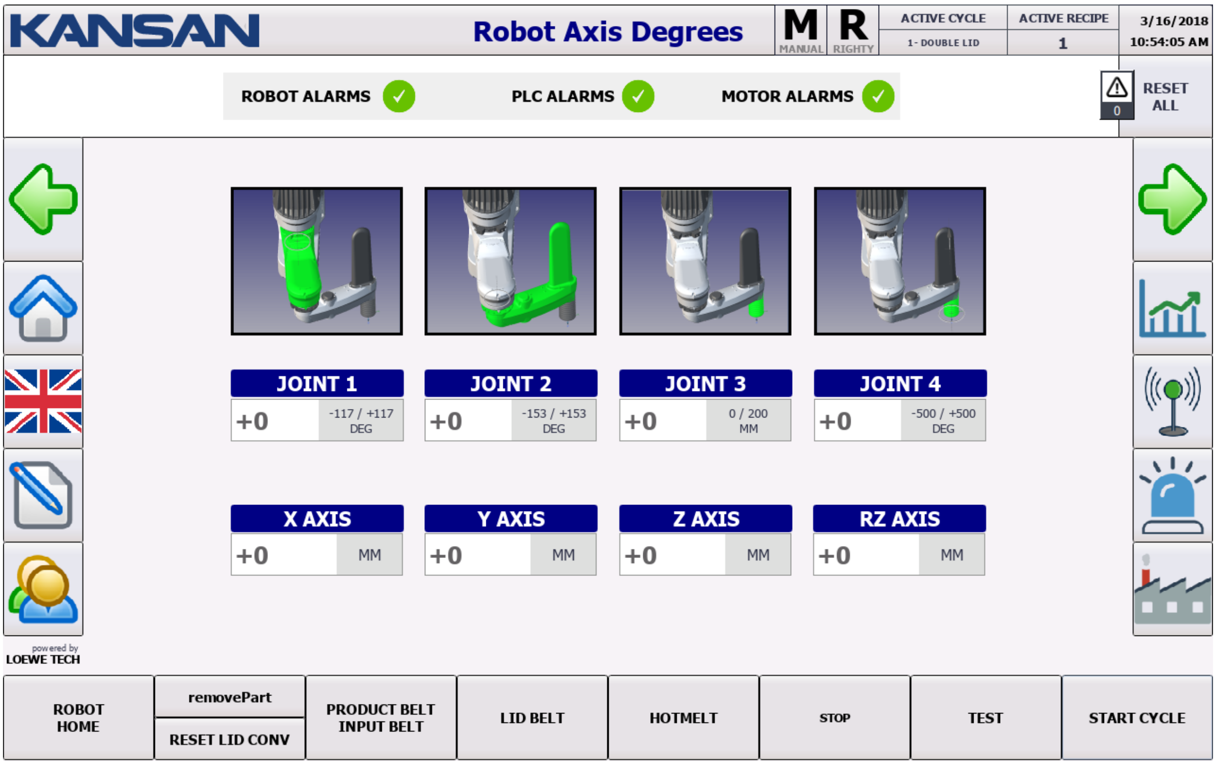
Features that can be set to Active / Passive on the machine are in this page.

ROBOT AXIS DEGREES

Instructions for the operator to display "ROBOT AXIS DEGREES" screen

✓ Press the symbol  on left of screen.

Incoming Screen



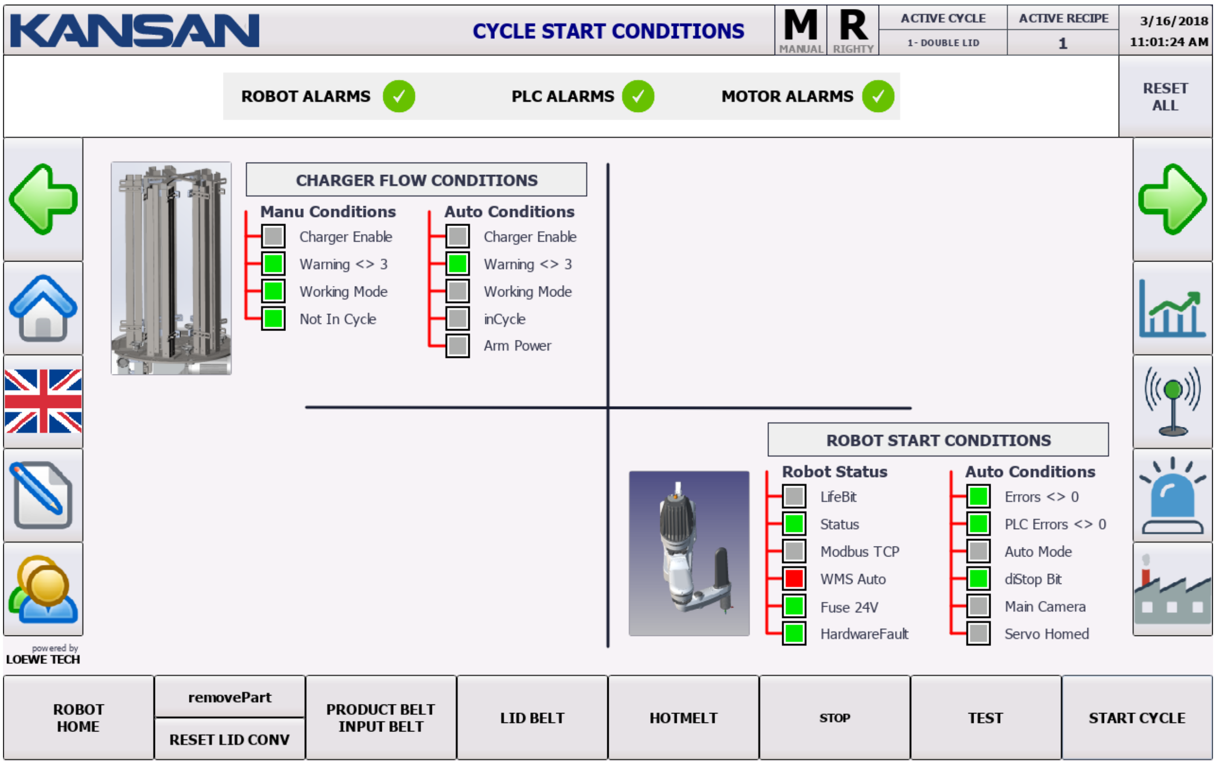
The current screen shows the robot axis degrees and robot tool cartesian coordinates and the instantaneous information when the robot is not in the cycle.

CYCLE START CONDITIONS

Instructions for the operator to display “CYCLE START CONDITIONS” screen

✓ Press the symbol  →  on left of screen.

<u>Incoming Screen</u>



The status of start preconditions belongs to 2 Cycles running in parallel is followed here.

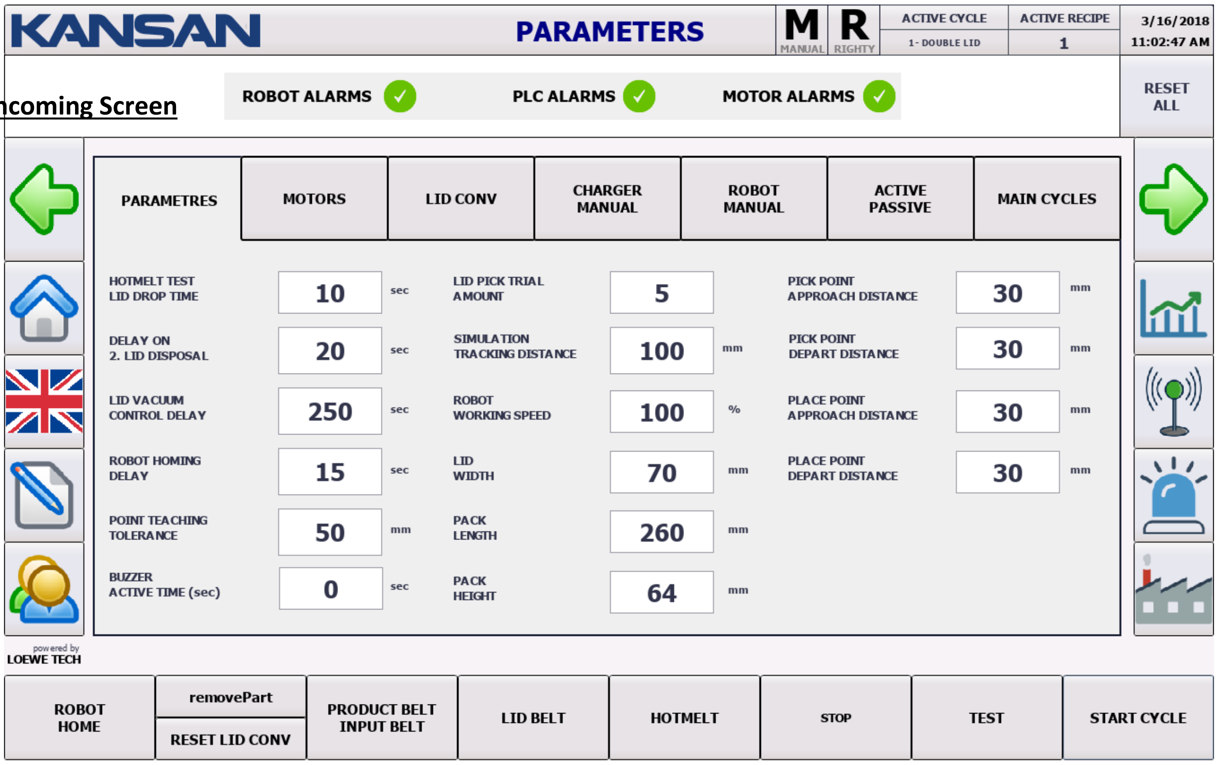
SETTINGS

Instructions fort he operator to display "SETTINGS" screen

✓ Press the symbol 

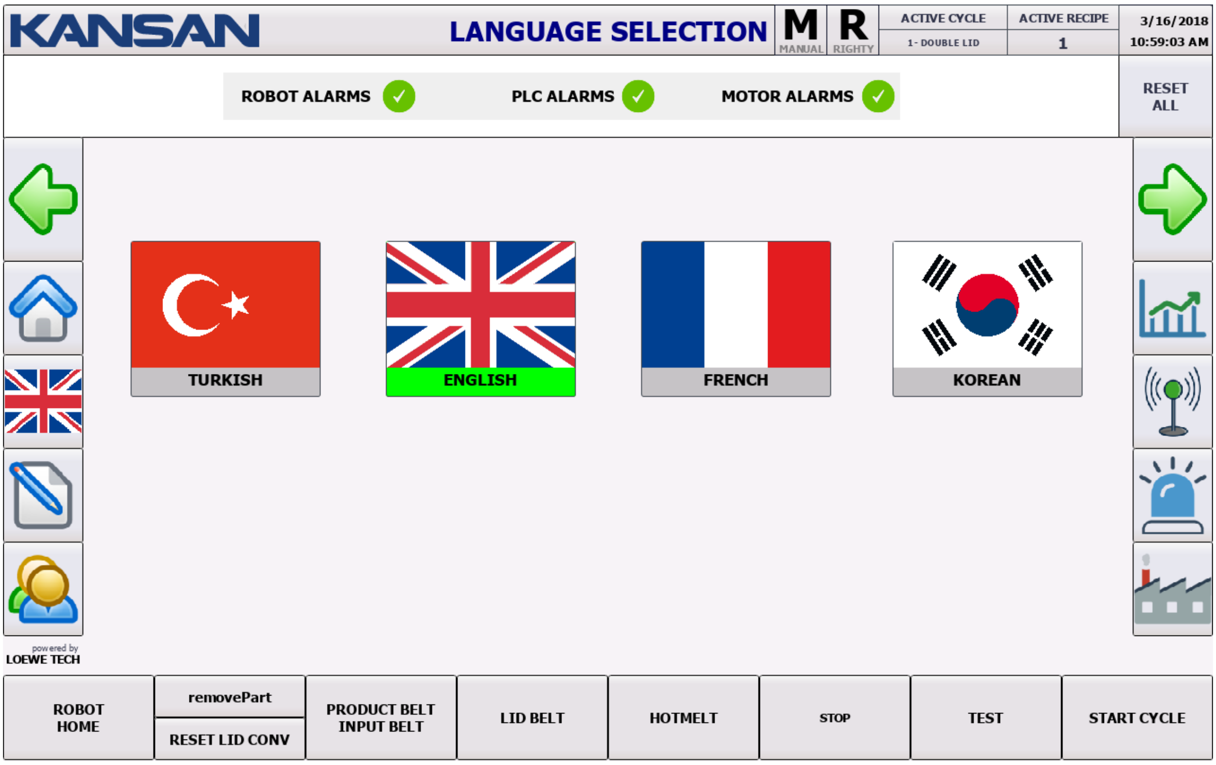
On left of screen.

Incoming Screen



The Current Display contains parameters and value settings for the machine.

LANGUAGE SELECTION



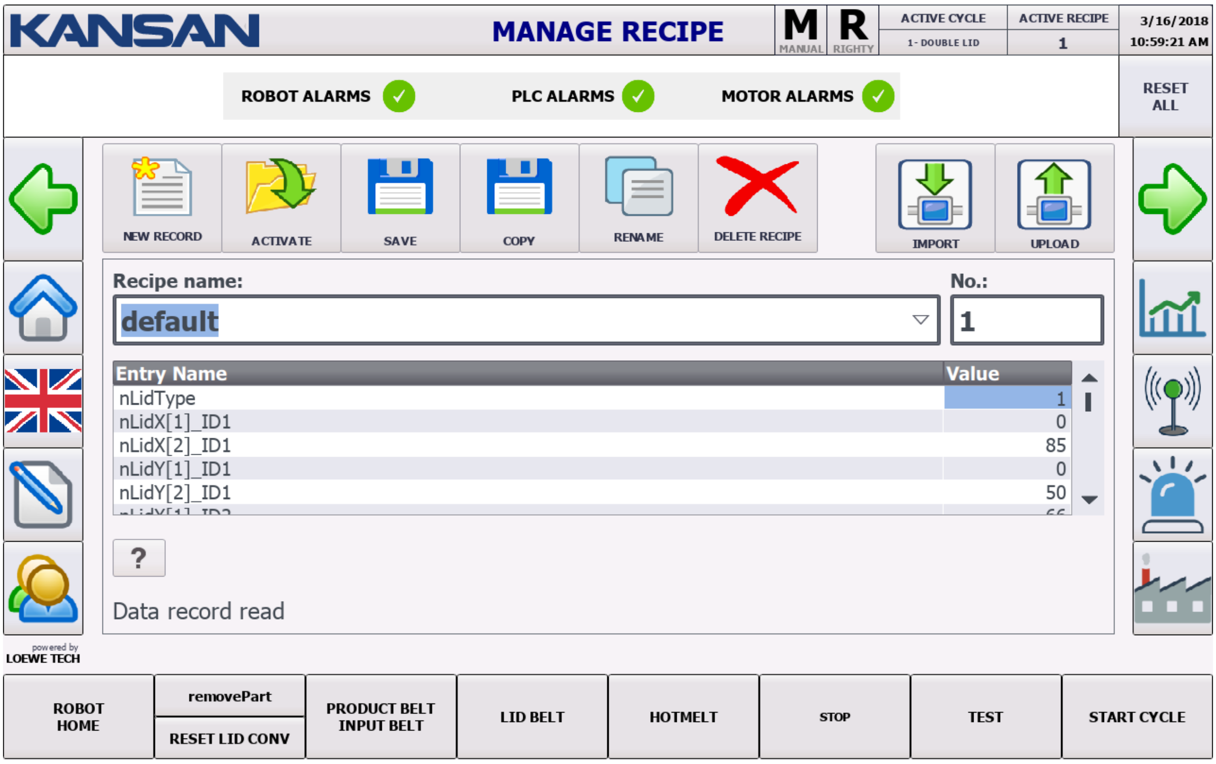
On the current page, Panel languages can be selected in Turkish, English, German, French and Russian languages.

MANAGE RECIPE

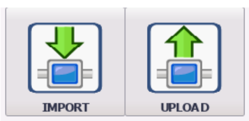
Instructions for the operator to display "MANAGE RECIPE" screen

✓ Press the symbol  on left of screen.

Incoming Screen



The current screen contains settings for recipe management.



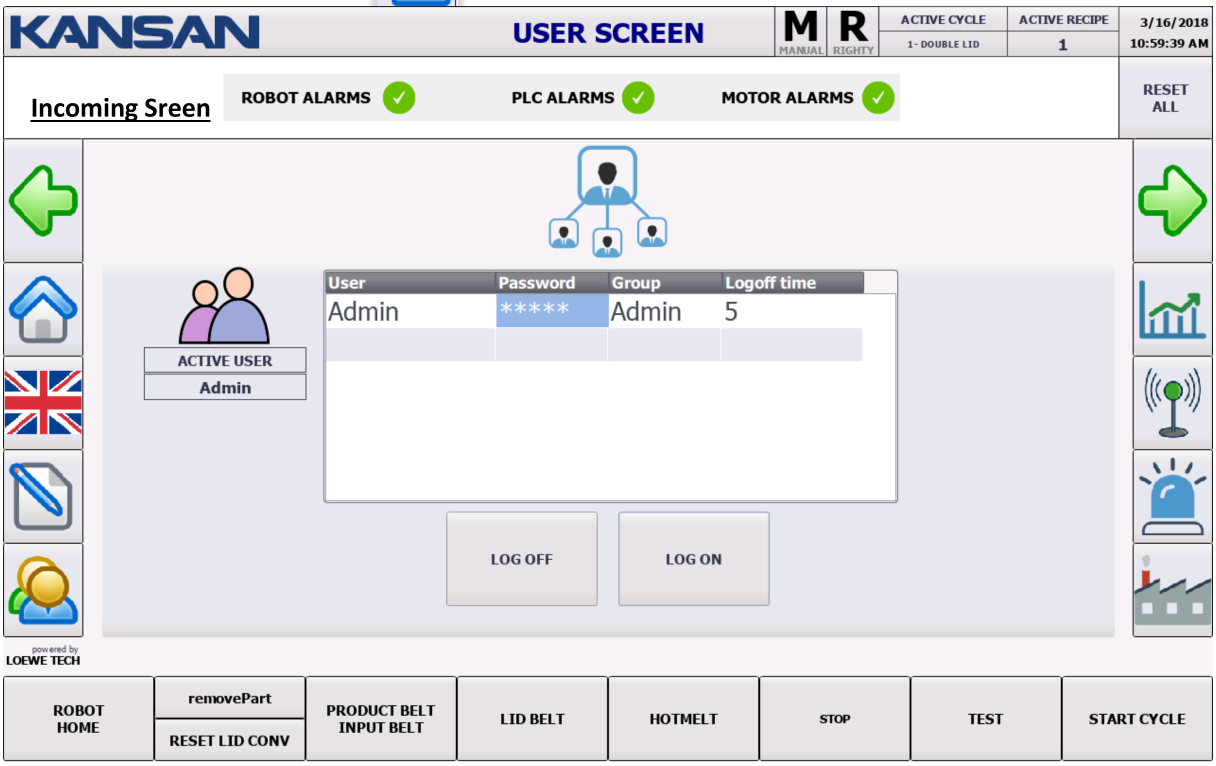
In order to transfer recipe to the machine, IMPORT/UPLOAD settings are used.

For this feature, the user must be authorized.

USER SCREEN

Instructions for the operator to display “USER SCREEN” screen

✓ Press the symbol  on left of screen.

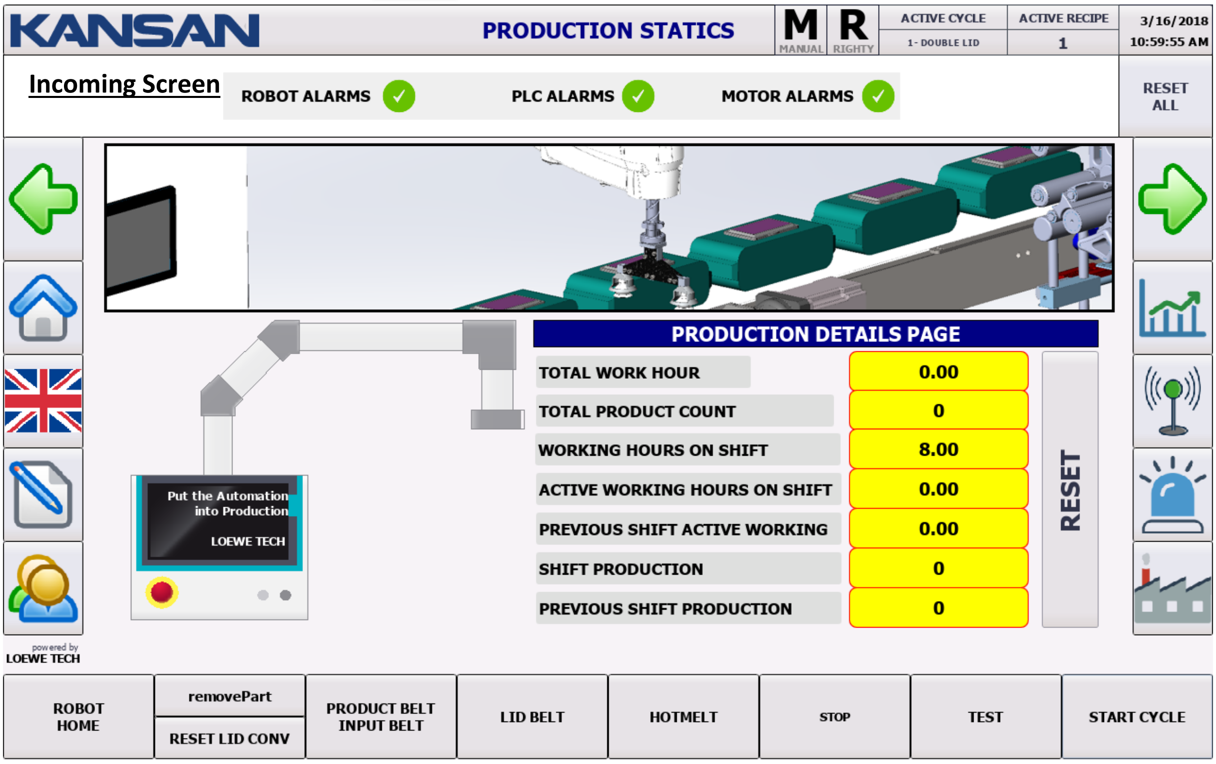


User settings are made on the current screen.

PRODUCTION STATICS

Instructions for the operator to display "PRODUCTION STATICS" screen

✓ Press the symbol  on left of screen.



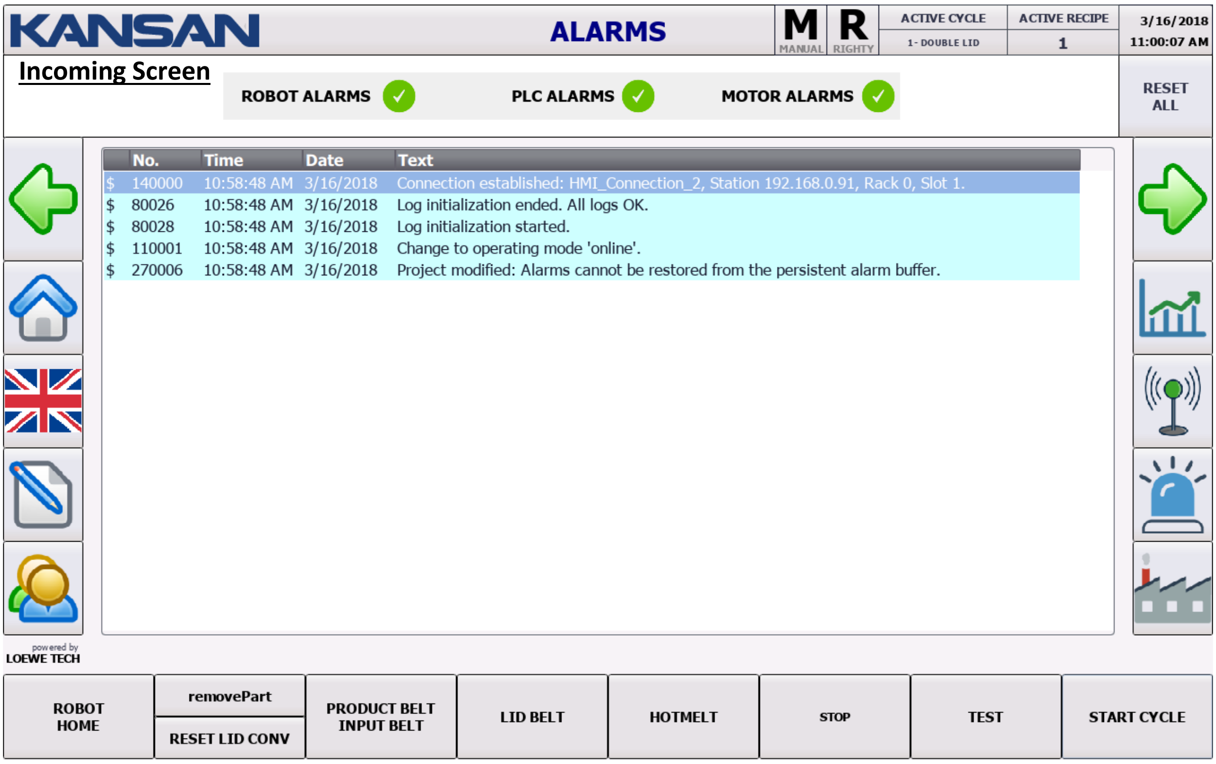
On Production Statics page, These can watch :

- ✓ Total Work Hour
- ✓ Total Product Count
- ✓ Working Hours On Shift
- ✓ Active Working Hours on Shift
- ✓ Previous Shift Active Working
- ✓ Shift Production
- ✓ Previous Shift Production.

ALARMS

Instructions for the operator to display "ALARMS" screen

✓ Press the symbol  on left of screen.

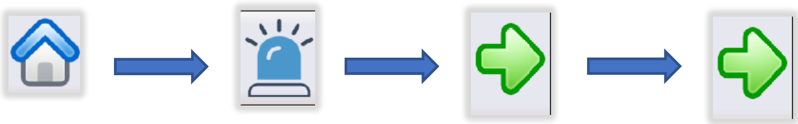


On Alarm Screen, current alarms on machine are listed.

PLC SYSTEM DIAG

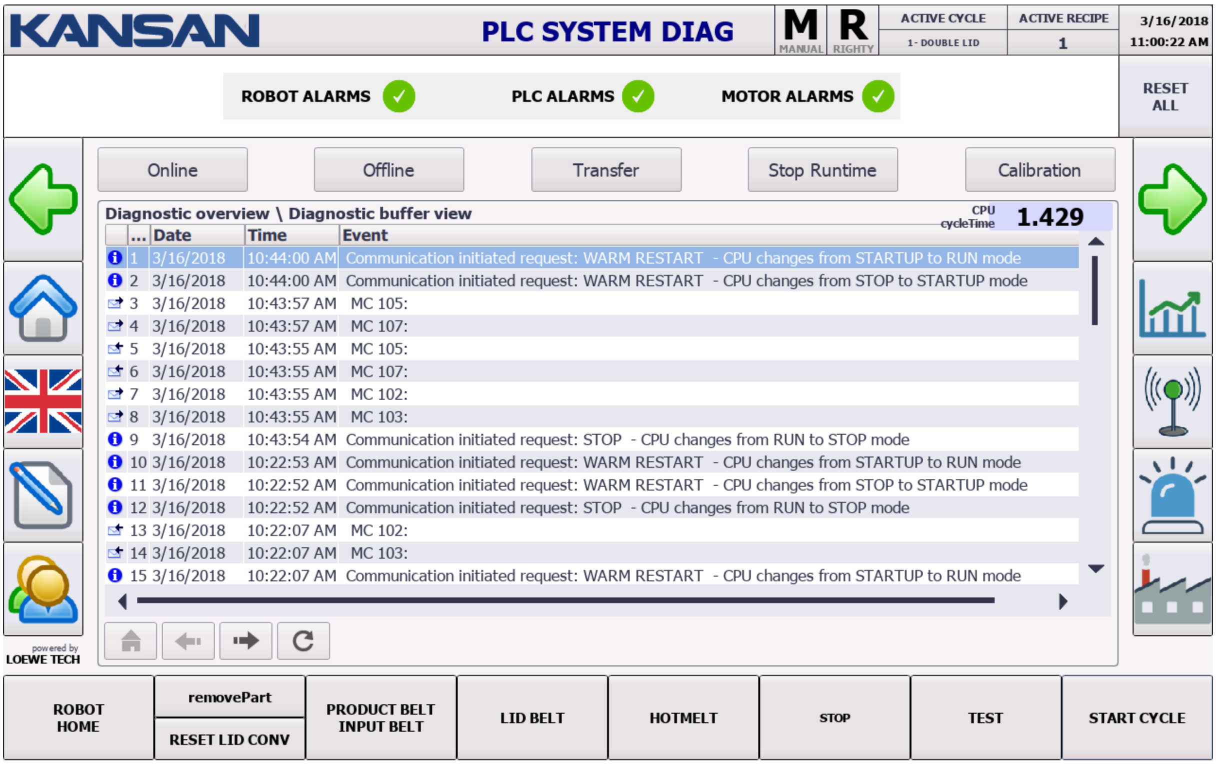
Instructions for the operator to display "PLC SYSTEM DIAG" screen

✓ Press the symbol



On left of screen.

<u>Incoming Screen</u>



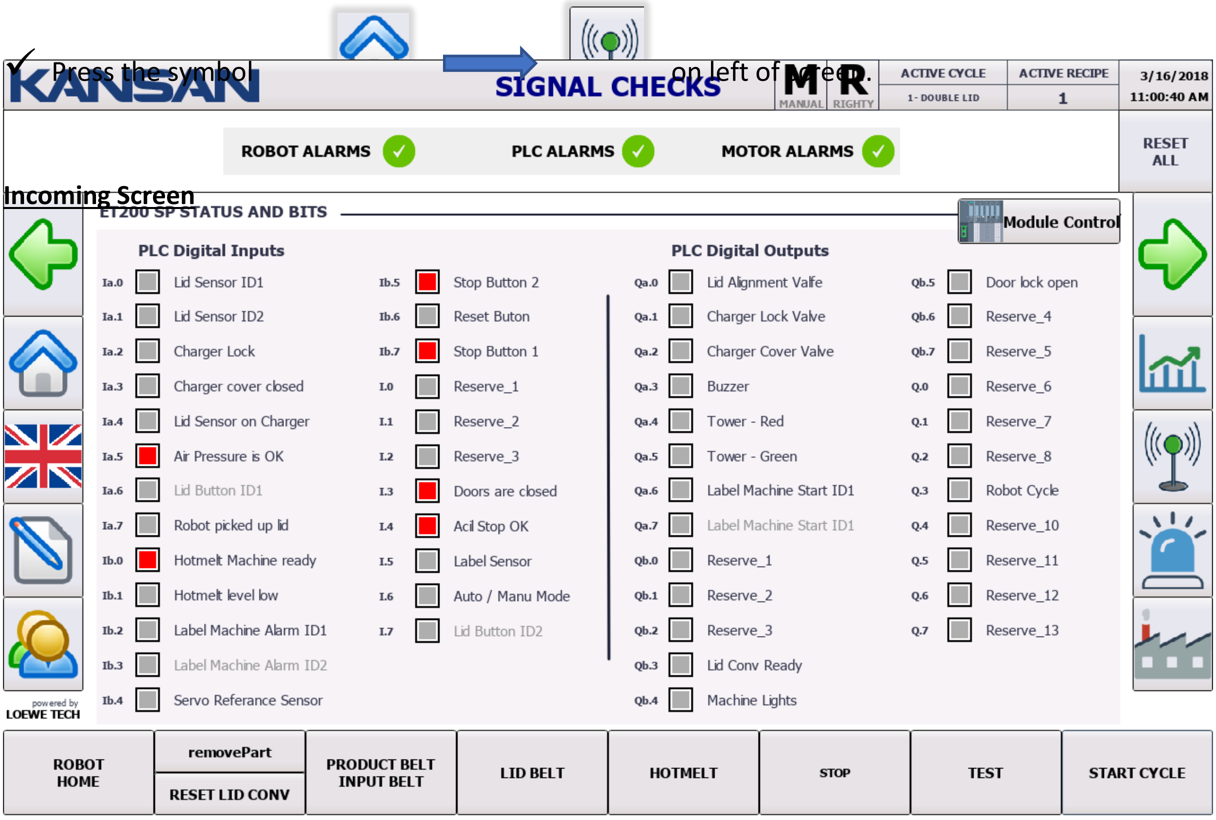
PLG SYSTEM DIAG is like in Picture.

SIGNAL CHECKS

Instructions for the operator to display “SIGNAL CHECKS” screen

✓ Press the symbol on left of screen.

Incoming Screen



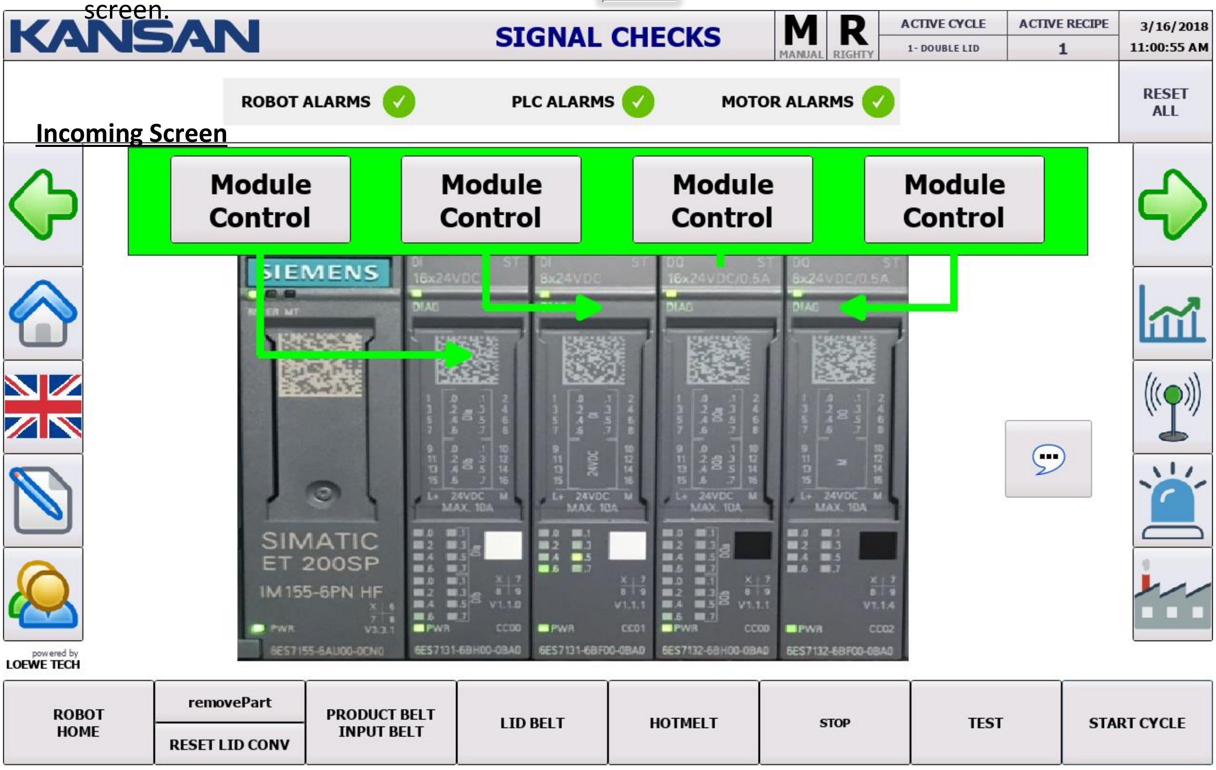
On the current page, SIGNAL CONTROLS are provided.

MODULE CONTROL

Instructions for the operator to display “MODULE CONTROL” page

✓ Press the symbol  on left of screen.

Incoming Screen



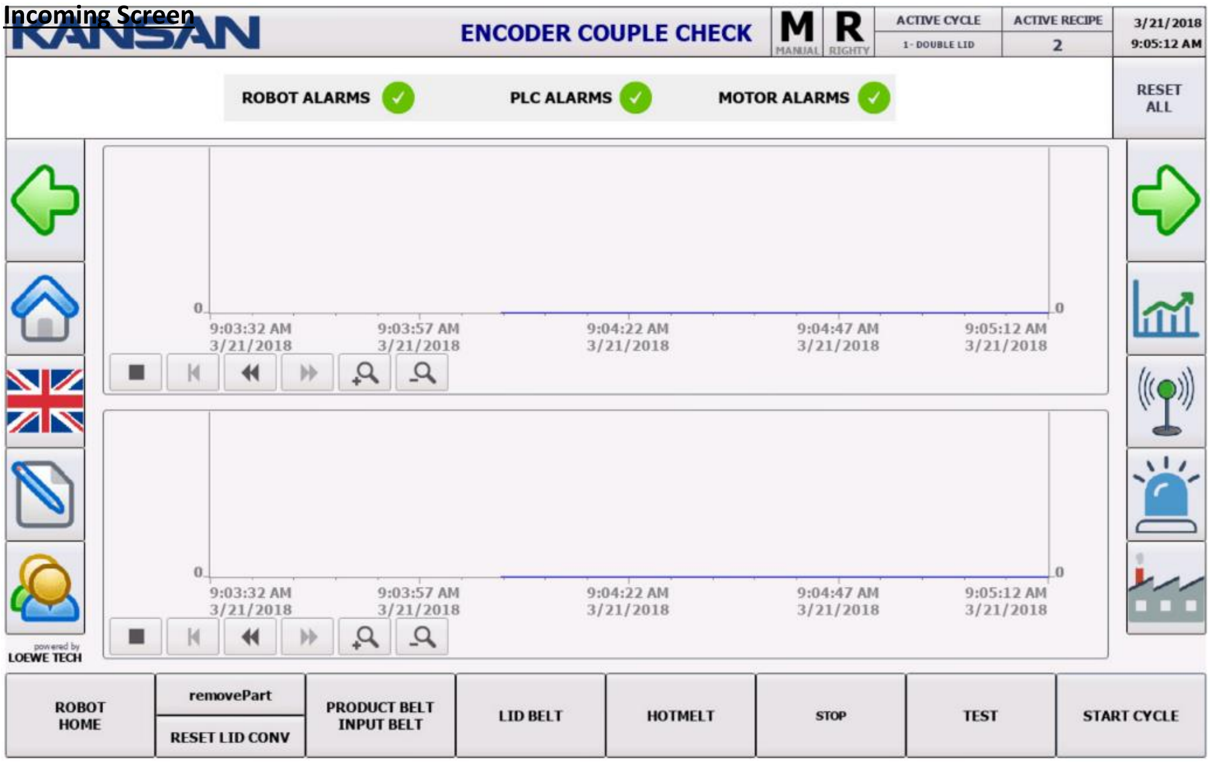
In the current page, the status of each module can be displayed.

ENCODER COUPLE CHECK

Instructions for the operator to display “ENCODER COUPLE CHECKS” screen

✓ Press the symbol  on left of screen.

Incoming Screen

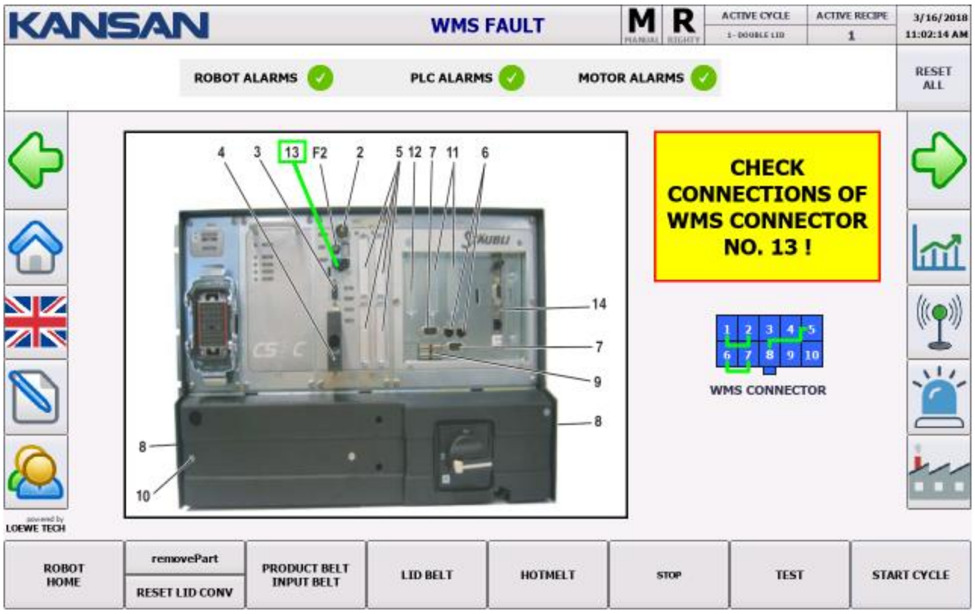


On the Current Screen, ENCODER COUPLED CONTROL is performed.

WARNINGS COMES ON SCREEN AFTER FAULT

WMS FAULT

When the WMS Connection error is present, the following warning screen automatically comes with its solution.



FUSE 24V FAULT

PART 8: MACHINE MAINTENANCE INSTRUCTIONS

PRECAUTIONS WHICH MUST BE TAKEN BEFORE MAINTENANCE

- **The operator should take his own safety precautions.**
- **Accessories such as necklaces, rings, watches should not be worn.**
- **It is necessary that the work clothes to be worn are not loose and that ID cards such as name badges can not be worn.**
- **Non-slip footwear and rubber wristband outfits should be worn.**
- **To obtain safety on the machine, air and electricity must be switch off.**
- **All mechanical settings must be recorded, even if they change during maintenance.**
- **• Equipments suitable for the area to be maintained should be selected and intervened with these equipments .**
- **If a fault is detected during maintenance, contact the authorized personnel or the manufacturer.**

WEEKLY PERIODIC MAINTENANCE INSTRUCTIONS

- Clean the machine thoroughly.

On cleaning time, all plumbing and nozzles are filled with liquid until the time set in the setting area, and the inside is cleaned.

- Clean the electrical panel with a vacuum cleaner.
- Clean the ventilation fan on the electric panel.
- Check the tension of all belts. Make the maintenance. Replace it with the same type if there is a wear belt.

The belts used in the machine should be kept in air firstly during the periodic maintenance and remove the dust, dirt or small particles. Then wipe the trigger belts with a damp cloth.

- Check all delrin gears. Replace the damaged ones.
- Check the body temperatures of the reductors.
- Discharge the Conditioner Drainage Water.

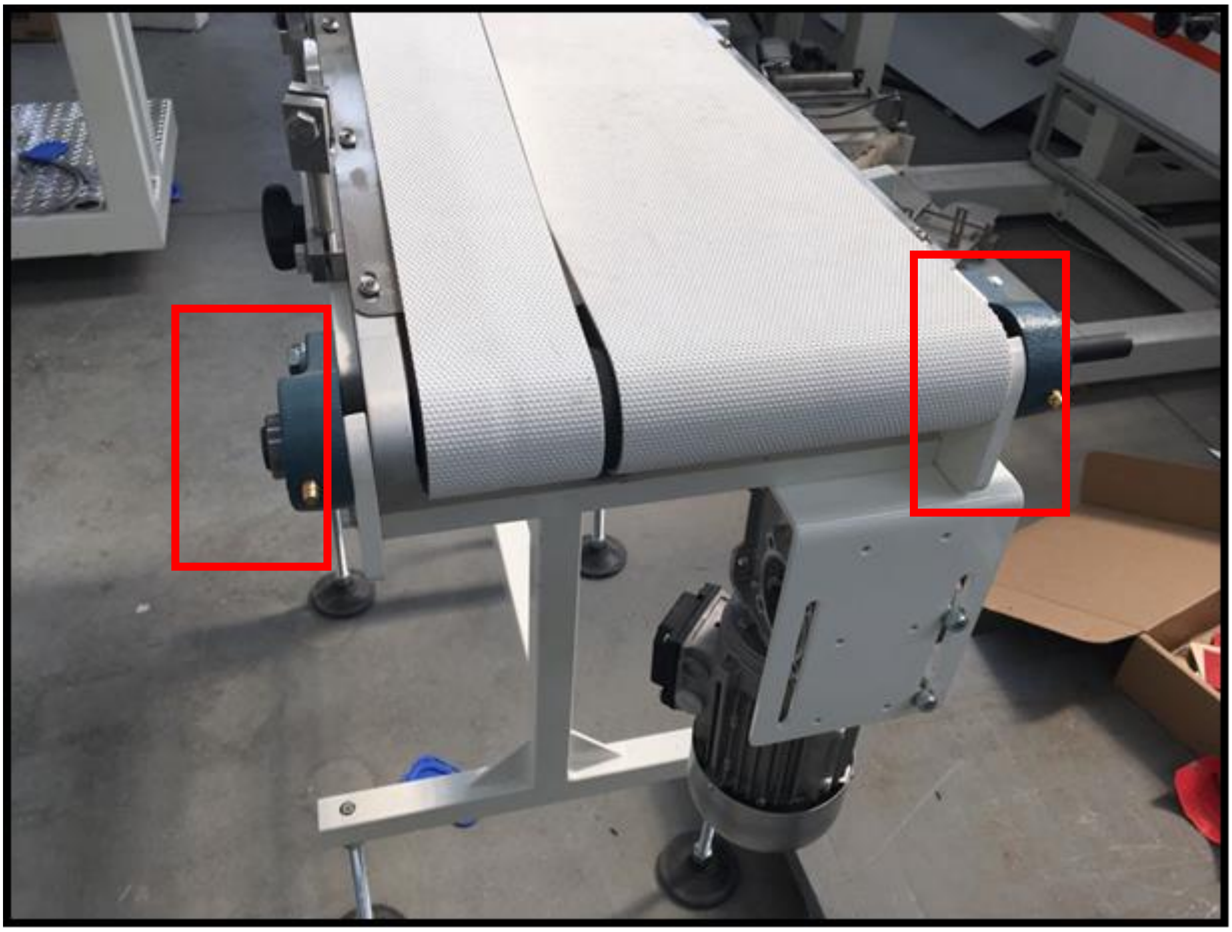
MONTHLY PERIODIC MAINTENANCE INSTRUCTIONS

- Check the tightness of all visible fixing bolts.
- Unscrew all the belts of the machine and check the gears, pulleys, bearings. Check the mechanics manually for any abnormalities. Change the bearings of non-rotating mechanisms.
- Clean the optical sensors before removing them.
- Check the filters of the ventilation covers every month.
- Make the maintenance ,visual control and tension control of conveyor belts.

In periodic maintenance, wipe the conveyor belt with a cloth dipped in acetone.

- Clean the rubber rollers with water, and powder after it is thoroughly dry.
- Check the conditioner oil.
- Lubricate all of the other linear slides on the machine.
- Clean the electric panel with a vacuum cleaner.
- Oil should be added to the grease lifting every month.

MECHANICAL LUBRICATION AREAS



Check the performance of these bearings and oil requirements on a monthly basis.

STAUBLI TP80 PERIODIC MAINTENANCE CHART

TP80 Preventive maintenance January 2016	Intervention level	Periodicity Every (first reached) Month	Year	5 years	2 500 hours	5 000 hours	10 000 hours	20 000 hours	40 000 hours
Safety									
External hard stops (option): Visual check, change if necessary	1	◊							
Fastenings (base, tool interface flange, etc.): Check tightness and for corrosion	1	◊							
Power light PWRL (option): Check, change if necessary	1	◊							
Check continuity of the protection circuit	2		◊						
General state of the arm									
External: Visual check for corrosion and collision damage	1	●							
Painted parts: Visual check, touch up the paintwork if it has been damaged	1	Δ	●						
Gear box (axis 1)									
Oil level: Check	1		●						
Operation (backlash, hard spots)	2		●						
Oil change	2			●		○ ● H1	●		
Replacement	3						○ H1	○ ● H1	●
Belt transmission									
Visual check	1		●						
Lubricate belts	1		●						
Lubricate needle bearing (joint 2)	1					●			
Belt roller : Check, replace if damaged	2						●		
Belts replacement (except the secondary belt on joint 2 transmission)	2						●		
Belt replacement (secondary belt on joint 2 transmission)	3						●		
Ball screw (axis 3 and 4)									
Clean, then lubricate ball screw	1				●				
Operation (backlash, hard spots)	2		●						
Ball screw replacement	2						○	●	
Sealing									
Lip seals : Visual check of seepage	1	Δ	●						
Lip seals : Replacement	3						Δ	●	
Cover seals : Visual check	1	Δ	●						
Cover seals : Replacement	1		Δ	●		Δ	●		
Bellows and bearings (option) : Check	1		●				●		
Bellows and bearings (option) : Replacement	2			●	Δ	●			
Electrical and pneumatic harness									
User harness (option): Visual check and lubricate (covers opened)	1				●				
User harness (option): Replacement	2					●			
Visual check of the harness and connectors, condition of the fixings (covers removed)	1		●						
Harness replacement	3						○	●	
Solenoid valves (option) : Check operation	1		●						
Solenoid valves (option) : Replacement Typical lifetime : 50 million cycle	1					●			
Balancing system									
Visual check	1		●						
Lubricate	1				●				
Replacement	2						●		

◊ Recommended periodicity : To be adapted in the light of the risk analysis for the application.
● Typical periodicity (« Standard maintenance » level from OptimizeLab).
○ Recommended typical periodicity for heavy duty applications. (« Adapted maintenance » level from OptimizeLab). Contact Stäubli service support.
Δ Recommended typical periodicity for applications in harsh environments (such as damp environments) or clean environments (such as CRs). Contact Stäubli service support.
H1 Typical periodicity for joint lubricated with H1 oil, if different from standard preventive maintenance periodicity (If not mentioned, use standard periodicity) . Contact Stäubli service support.

PART 9: PROBLEMS AND SOLUTIONS

LABEL ON LID STCKING LOOSE ON “Y”AXIS

If the label sticks loose on the "Y" axis on the lid, you can find the solution by changing the parameter offset from the label on the screen. The parameter value must be lowered if the label farther away from lid , and the parameter value should be raised if the label is behind the lid .

LABEL ON LID STCKING LOOSE ON “X”AXIS

If the label sticks loose on the "X" axis on the lid, it is adjusted by sliding the label unit back and forth with the help of the bakelite as shown in the right picture.

LID APPLICATING POSITION STICK LOOSE BACK AND FORWARD

- Check the encoder coupling attached to the main conveyor in the cabinet. If it is broken, it must be replaced.
- Check the tension of the main conveyor belt, if not stretched, tighten the conveyor belt.

PACKAGE OUT OF LID APPLICATING

- Make sure that the machine is started in automatic mode.
- Make sure the label is correctly taught.
- On the camera screen, make sure that the label photo appears in the correct location.
- Make sure the camera takes the photo in the right place.
- If the camera trigger sensor is flashing, it will take a different position on the band, this setting should be corrected.
- Package size must be entered correctly.

HOTMELT NOZZLE THROWS INTENSIVE HOTMELT

- Check the air pressure, decrease the pressure.

HOTMELT NOZZLE THROWS LITTLE HOTMELT OR DOES NOT THROW

- Check the air pressure, if the pressure is low, increase the pressure.
- Check if there is a blockage in the nozzle; If ther is, replace or clean it.
- The nozzle may be impacted or crushed, replace it.

CLEANING AND CHANGE OF HOTMELT NOZZLE

- In case of not throwing or throwing hotmelt little, the hotmelt nozzle should be replaced or cleaned.
- Make sure that the machine is switched off or the emergency stop button is pressed before changing the nozzle.
- Dismantle nozzles because of safety precautions with protective googles and gloves
- After you install the new nozzles, clean the dirty nozzles with the cleaning needle attached to the machine by holding the dirty nozzles in the cleaning fluid.
